Note

- Address expansion for 16-Mbit. NC pin not connected to die.

Pin Definitions

Pin Name	I/O Type	Description
A ₀ –A ₁₉	Input	Address inputs. Used to select one of the 1,048,576 bytes of the nvSRAM for × 8 configuration.
A ₀ –A ₁₈		Address inputs. Used to select one of the 524,288 words of the nvSRAM for × 16 configuration.
DQ ₀ –DQ ₇	Input/Output	Bidirectional data I/O lines for × 8 configuration. Used as input or output lines depending on operation.
DQ ₀ –DQ ₁₅		Bidirectional data I/O lines for × 16 configuration. Used as input or output lines depending on operation.
$\overline{\text{WE}}$	Input	Write Enable input, Active LOW. When selected LOW, data on the I/O pins is written to the specific address location.
$\overline{\text{CE}}$	Input	Chip Enable input, Active LOW. When LOW, selects the chip. When HIGH, deselects the chip.
$\overline{\text{OE}}$	Input	Output Enable, Active LOW. The active LOW $\overline{\text{OE}}$ input enables the data output buffers during read cycles. I/O pins are tristated on deasserting $\overline{\text{OE}}$ HIGH.
$\overline{\text{BHE}}$	Input	Byte High Enable, Active LOW. Controls DQ ₁₅ –DQ ₈ .
$\overline{\text{BLE}}$	Input	Byte Low Enable, Active LOW. Controls DQ ₇ –DQ ₀ .
V _{SS}	Ground	Ground for the device. Must be connected to the ground of the system.
V _{CC}	Power supply	Power supply inputs to the device.
$\overline{\text{HSB}}$	Input/Output	Hardware STORE Busy ($\overline{\text{HSB}}$). When LOW this output indicates that a Hardware STORE is in progress. When pulled LOW external to the chip it initiates a nonvolatile STORE operation. After each Hardware and Software STORE operation, $\overline{\text{HSB}}$ is driven HIGH for a short time (t _{HHHD}) with standard output high current and then a weak internal pull-up resistor keeps this pin HIGH (external pull-up resistor connection optional).
V _{CAP}	Power supply	AutoStore capacitor. Supplies power to the nvSRAM during power loss to store data from SRAM to nonvolatile elements.
NC	No connect	No connect. This pin is not connected to the die.

Device Operation

The CY14B108L/CY14B108N nvSRAM is made up of two functional components paired in the same physical cell. They are a SRAM memory cell and a nonvolatile QuantumTrap cell. The SRAM memory cell operates as a standard fast static RAM. Data in the SRAM is transferred to the nonvolatile cell (the STORE operation), or from the nonvolatile cell to the SRAM (the RECALL operation). Using this unique architecture, all cells are stored and recalled in parallel. During the STORE and RECALL operations, SRAM read and write operations are inhibited. The CY14B108L/CY14B108N supports infinite reads and writes similar to a typical SRAM. In addition, it provides infinite RECALL operations from the nonvolatile cells and up to 1 million STORE operations. See [Truth Table For SRAM Operations on page 18](#) for a complete description of read and write modes.

SRAM Read

The CY14B108L/CY14B108N performs a read cycle when $\overline{CE}$ and $\overline{OE}$ are LOW and $\overline{WE}$ and $\overline{HSB}$ are HIGH. The address specified on pins A_{0-19} or A_{0-18} determines which of the 1,048,576 data bytes or 524,288 words of 16 bits each are accessed. Byte enables ($\overline{BHE}$, $\overline{BLE}$) determine which bytes are enabled to the output, in the case of 16-bit words. When the read is initiated by an address transition, the outputs are valid after a delay of t_{AA} (read cycle 1). If the read is initiated by $\overline{CE}$ or $\overline{OE}$, the outputs are valid at t_{ACE} or at t_{DOE} , whichever is later (read cycle 2). The data output repeatedly responds to address changes within the t_{AA} access time without the need for transitions on any control input pins. This remains valid until another address change or until $\overline{CE}$ or $\overline{OE}$ is brought HIGH, or $\overline{WE}$ or $\overline{HSB}$ is brought LOW.

SRAM Write

A write cycle is performed when $\overline{CE}$ and $\overline{WE}$ are LOW and $\overline{HSB}$ is HIGH. The address inputs must be stable before entering the write cycle and must remain stable until $\overline{CE}$ or $\overline{WE}$ goes HIGH at the end of the cycle. The data on the common I/O pins DQ_{0-15} are written into the memory if the data is valid t_{SD} before the end of a $\overline{WE}$ controlled write or before the end of an $\overline{CE}$ controlled write. The Byte Enable inputs ($\overline{BHE}$, $\overline{BLE}$) determine which bytes are written, in the case of 16-bit words. Keep $\overline{OE}$ HIGH during the entire write cycle to avoid data bus contention on common I/O lines. If $\overline{OE}$ is left LOW, internal circuitry turns off the output buffers t_{HZWE} after $\overline{WE}$ goes LOW.

AutoStore Operation

The CY14B108L/CY14B108N stores data to the nvSRAM using one of the following three storage operations: Hardware STORE activated by the $\overline{HSB}$; Software STORE activated by an address sequence; AutoStore on device power-down. The AutoStore operation is a unique feature of QuantumTrap technology and is enabled by default on the CY14B108L/CY14B108N.

During a normal operation, the device draws current from V_{CC} to charge a capacitor connected to the V_{CAP} pin. This stored charge is used by the chip to perform a single STORE operation. If the voltage on the V_{CC} pin drops below V_{SWITCH} , the part automatically disconnects the V_{CAP} pin from V_{CC} . A STORE operation is initiated with power provided by the V_{CAP} capacitor.

Note If the capacitor is not connected to V_{CAP} pin, AutoStore must be disabled using the soft sequence specified in [Preventing](#)

[AutoStore on page 8](#). In case AutoStore is enabled without a capacitor on V_{CAP} pin, the device attempts an AutoStore operation without sufficient charge to complete the Store. This corrupts the data stored in nvSRAM.

Figure 3 shows the proper connection of the storage capacitor (V_{CAP}) for automatic STORE operation. Refer to [DC Electrical Characteristics on page 9](#) for the size of V_{CAP} . The voltage on the V_{CAP} pin is driven to V_{CC} by a regulator on the chip. A pull-up should be placed on $\overline{WE}$ to hold it inactive during power-up. This pull-up is effective only if the $\overline{WE}$ signal is tristate during power-up. Many MPUs tristate their controls on power-up. This should be verified when using the pull-up. When the nvSRAM comes out of power-on-RECALL, the MPU must be active or the $\overline{WE}$ held inactive until the MPU comes out of reset.

To reduce unnecessary nonvolatile STOREs, AutoStore and Hardware STORE operations are ignored unless at least one write operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a write operation has taken place. The $\overline{HSB}$ signal is monitored by the system to detect if an AutoStore cycle is in progress.

Figure 3. AutoStore Mode

Hardware STORE Operation

The CY14B108L/CY14B108N provides the $\overline{HSB}$ pin to control and acknowledge the STORE operations. Use the $\overline{HSB}$ pin to request a Hardware STORE cycle. When the $\overline{HSB}$ pin is driven LOW, the CY14B108L/CY14B108N conditionally initiates a STORE operation after t_{DELAY} . An actual STORE cycle only begins if a write to the SRAM has taken place since the last STORE or RECALL cycle. The $\overline{HSB}$ pin also acts as an open drain driver (internal 100 k Ω weak pull-up resistor) that is internally driven LOW to indicate a busy condition when the STORE (initiated by any means) is in progress.

Note After each Hardware and Software STORE operation $\overline{HSB}$ is driven HIGH for a short time (t_{HHHD}) with standard output high current and then remains HIGH by internal 100 k Ω pull-up resistor.

SRAM write operations that are in progress when $\overline{\text{HSB}}$ is driven LOW by any means are given time (t_{DELAY}) to complete before the STORE operation is initiated. However, any SRAM write cycles requested after $\overline{\text{HSB}}$ goes LOW are inhibited until $\overline{\text{HSB}}$ returns HIGH. In case the write latch is not set, $\overline{\text{HSB}}$ is not driven LOW by the CY14B108L/CY14B108N. But any SRAM read and write cycles are inhibited until $\overline{\text{HSB}}$ is returned HIGH by MPU or other external source.

During any STORE operation, regardless of how it is initiated, the CY14B108L/CY14B108N continues to drive the $\overline{\text{HSB}}$ pin LOW, releasing it only when the STORE is complete. Upon completion of the STORE operation, the nvSRAM memory access is inhibited for t_{LZHSB} time after $\overline{\text{HSB}}$ pin returns HIGH. Leave the $\overline{\text{HSB}}$ unconnected if it is not used.

Hardware RECALL (Power-Up)

During power-up or after any low power condition ($V_{\text{CC}} < V_{\text{SWITCH}}$), an internal RECALL request is latched. When V_{CC} again exceeds the V_{SWITCH} on power-up, a RECALL cycle is automatically initiated and takes t_{HRECALL} to complete. During this time, the $\overline{\text{HSB}}$ pin is driven LOW by the $\overline{\text{HSB}}$ driver and all reads and writes to nvSRAM are inhibited.

Software STORE

Data is transferred from the SRAM to the nonvolatile memory by a software address sequence. The CY14B108L/CY14B108N Software STORE cycle is initiated by executing sequential $\overline{\text{CE}}$ or $\overline{\text{OE}}$ controlled read cycles from six specific address locations in exact order. During the STORE cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. After a STORE cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of READs from specific addresses is used for STORE initiation, it is important that no other read or write accesses intervene in the sequence, or the sequence is aborted and no STORE or RECALL takes place.

To initiate the Software STORE cycle, the following read sequence must be performed.

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8FC0 Initiate STORE cycle

The software sequence may be clocked with $\overline{\text{CE}}$ controlled reads or $\overline{\text{OE}}$ controlled reads, with $\overline{\text{WE}}$ kept HIGH for all the six READ sequences. After the sixth address in the sequence is entered, the STORE cycle commences and the chip is disabled. $\overline{\text{HSB}}$ is driven LOW. After the t_{STORE} cycle time is fulfilled, the SRAM is activated again for the read and write operation.

Software RECALL

Data is transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of read operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of $\overline{\text{CE}}$ or $\overline{\text{OE}}$ controlled read operations must be performed.

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4C63 Initiate RECALL cycle

Internally, RECALL is a two-step procedure. First, the SRAM data is cleared; then, the nonvolatile information is transferred into the SRAM cells. After the t_{RECALL} cycle time, the SRAM is again ready for read and write operations. The RECALL operation does not alter the data in the nonvolatile elements.

Table 1. Mode Selection

Errata: AutoStore Disable feature does not work in the device. For more information, see [Errata on page 24](#).

Notes

- BHE and BLE are applicable for × 16 configuration only.
- While there are 20 address lines on the CY14B108L (19 address lines on the CY14B108N), only the 13 address lines ($\text{A}_{14}-\text{A}_2$) are used to control software modes. Rest of the address lines are don't care.
- The six consecutive address locations must be in the order listed. $\overline{\text{WE}}$ must be HIGH during all six cycles to enable a nonvolatile cycle.

Preventing AutoStore

The AutoStore function is disabled by initiating an AutoStore disable sequence. A sequence of read operations is performed in a manner similar to the Software STORE initiation. To initiate the AutoStore disable sequence, the following sequence of $\overline{CE}$ or $\overline{OE}$ controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8B45 AutoStore Disable

Note Errata: AutoStore Disable feature does not work in the device. For more information, see [Errata on page 24](#).

The AutoStore is re-enabled by initiating an AutoStore enable sequence. A sequence of read operations is performed in a manner similar to the Software RECALL initiation. To initiate the

AutoStore enable sequence, the following sequence of $\overline{CE}$ or $\overline{OE}$ controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4B46 AutoStore Enable

If the AutoStore function is disabled or re-enabled, a manual STORE operation (Hardware or Software) must be issued to save the AutoStore state through subsequent power-down cycles. The part comes from the factory with AutoStore enabled and 0x00 written in all cells.

Data Protection

The CY14B108L/CY14B108N protects data from corruption during low voltage conditions by inhibiting all externally initiated STORE and write operations. The low voltage condition is detected when $V_{CC} < V_{SWITCH}$. If the CY14B108L/CY14B108N is in a write mode (both $\overline{CE}$ and $\overline{WE}$ are LOW) at power-up, after a RECALL or STORE, the write is inhibited until the SRAM is enabled after t_{LZHSB} (HSB to output active). This protects against inadvertent writes during power-up or brown out conditions.

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature -65 °C to +150 °C

Maximum accumulated storage time

At 150 °C ambient temperature 1000 h

At 85 °C ambient temperature 20 Years

Maximum junction temperature 150 °C

Supply voltage on V_{CC} relative to V_{SS} -0.5 V to 4.1 V

Voltage applied to outputs

in High Z state -0.5 V to $V_{CC} + 0.5$ V

Input voltage -0.5 V to $V_{CC} + 0.5$ V

Transient voltage (< 20 ns) on

any pin to ground potential -2.0 V to $V_{CC} + 2.0$ V

Package power dissipation

capability ($T_A = 25$ °C) 1.0 W

Surface mount Pb soldering

temperature (3 Seconds) +260 °C

DC output current (1 output at a time, 1s duration) 15 mA

Static discharge voltage

(per MIL-STD-883, Method 3015) > 2001 V

Latch up current > 200 mA

Operating Range

Range	Ambient Temperature	V_{CC}
Industrial	-40 °C to +85 °C	2.7 V to 3.6 V

Θ_{JC}	Thermal resistance (Junction to case)		6.3	5.2	8.26	$^\circ C/W$

Notes

10. Min V_{CAP} value guarantees that there is a sufficient charge available to complete a successful AutoStore operation. Max V_{CAP} value guarantees that the capacitor on V_{CAP} is charged to a minimum voltage during a Power-Up RECALL cycle so that an immediate power-down cycle can complete a successful AutoStore. Therefore it is always recommended to use a capacitor within the specified min and max limits. Refer application note [AN43593](#) for more details on V_{CAP} options.
11. Maximum voltage on V_{CAP} pin ($V_{V_{CAP}}$) is provided for guidance when choosing the V_{CAP} capacitor. The voltage rating of the V_{CAP} capacitor across the operating temperature range should be higher than the $V_{V_{CAP}}$ voltage.
12. These parameters are guaranteed by design and are not tested.

Figure 9. SRAM Write Cycle #3 ($\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ Controlled) [25, 26, 27, 28]

Notes

25. $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ are applicable for $\times 16$ configuration only.
26. If $\overline{\text{WE}}$ is LOW when $\overline{\text{CE}}$ goes LOW, the outputs remain in the high impedance state.
27. $\overline{\text{HSB}}$ must remain HIGH during READ and WRITE cycles.
28. $\overline{\text{CE}}$ or $\overline{\text{WE}}$ must be $\geq V_{IH}$ during address transitions.

AutoStore/Power-Up RECALL

Over the [Operating Range](#)

Parameter	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
$t_{HRECALL}^{[29]}$	Power-Up RECALL duration	–	20	–	20	–	20	ms
$t_{STORE}^{[30]}$	STORE cycle duration	–	8	–	8	–	8	ms
$t_{DELAY}^{[31]}$	Time allowed to complete SRAM write cycle	–	20	–	25	–	25	ns
V_{SWITCH}	Low voltage trigger level	–	2.65	–	2.65	–	2.65	V
$t_{VCCRRISE}^{[32]}$	V_{CC} rise time	150	–	150	–	150	–	μ s
$V_{HDIS}^{[32]}$	HSB output disable voltage	–	1.9	–	1.9	–	1.9	V
$t_{LZHSB}^{[32]}$	HSB to output active time	–	5	–	5	–	5	μ s
$t_{HHHD}^{[32]}$	HSB high active time	–	500	–	500	–	500	ns

Switching Waveforms

Figure 10. AutoStore or Power-Up RECALL ^[33]

Notes

29. $t_{HRECALL}$ starts from the time V_{CC} rises above V_{SWITCH} .
30. If an SRAM write has not taken place since the last nonvolatile cycle, no AutoStore or Hardware STORE takes place.
31. On a Hardware STORE and AutoStore initiation, SRAM write operation continues to be enabled for time t_{DELAY} .
32. These parameters are guaranteed by design but not tested.
33. Read and Write cycles are ignored during STORE, RECALL, and while V_{CC} is below V_{SWITCH} .
34. During power-up and power-down, HSB glitches when HSB pin is pulled up through an external resistor.

Software Controlled STORE/RECALL Cycle

Over the [Operating Range](#)

Parameter ^[35, 36]	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
t_{RC}	STORE/RECALL initiation cycle time	20	–	25	–	45	–	ns
t_{SA}	Address setup time	0	–	0	–	0	–	ns
t_{CW}	Clock pulse width	15	–	20	–	30	–	ns
t_{HA}	Address hold time	0	–	0	–	0	–	ns
t_{RECALL}	RECALL duration	–	200	–	200	–	200	μ s

Switching Waveforms

Figure 11. $\overline{CE}$ and $\overline{OE}$ Controlled Software STORE/RECALL Cycle ^[36]

Figure 12. Autostore Enable/Disable Cycle ^[36]

Notes

35. The software sequence is clocked with $\overline{CE}$ controlled or $\overline{OE}$ controlled reads.

36. The six consecutive addresses must be read in the order listed in [Table 1 on page 7](#). $\overline{WE}$ must be HIGH during all six consecutive cycles.

37. DQ output data at the sixth read may be invalid since the output is disabled at t_{DELAY} time.

Hardware STORE Cycle

Over the [Operating Range](#)

Parameter	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
t_{DHSB}	HSB to output active time when write latch not set	–	20	–	25	–	25	ns
t_{PHSB}	Hardware STORE pulse width	15	–	15	–	15	–	ns
$t_{\text{SS}}^{[38, 39]}$	Soft sequence processing time	–	100	–	100	–	100	μs

Switching Waveforms

Figure 13. Hardware STORE Cycle ^[40]

Figure 14. Soft Sequence Processing ^[38, 39]

Notes

38. This is the amount of time it takes to take action on a soft sequence command. V_{CC} power must remain HIGH to effectively register command.
39. Commands such as STORE and RECALL lock out I/O until operation is complete which further increases this time. See the specific command.
40. If an SRAM write has not taken place since the last nonvolatile cycle, no AutoStore or Hardware STORE takes place.

Truth Table For SRAM Operations

HSB should remain HIGH for SRAM Operations.

Table 2. Truth Table for × 8 Configuration

$\overline{\text{CE}}$	$\overline{\text{WE}}$	$\overline{\text{OE}}$	Inputs/Outputs ^[41]	Mode	Power
H	X	X	High Z	Deselect/Power-down	Standby
L	H	L	Data out (DQ ₀ –DQ ₇);	Read	Active
L	H	H	High Z	Output disabled	Active
L	L	X	Data in (DQ ₀ –DQ ₇);	Write	Active

Table 3. Truth Table for × 16 Configuration

$\overline{\text{CE}}$	$\overline{\text{WE}}$	$\overline{\text{OE}}$	$\overline{\text{BHE}}$ ^[42]	$\overline{\text{BLE}}$ ^[42]	Inputs/Outputs ^[41]	Mode	Power
H	X	X	X	X	High Z	Deselect/Power-down	Standby
L	X	X	H	H	High Z	Output disabled	Active
L	H	L	L	L	Data out (DQ ₀ –DQ ₁₅)	Read	Active
L	H	L	H	L	Data out (DQ ₀ –DQ ₇); DQ ₈ –DQ ₁₅ in High Z	Read	Active
L	H	L	L	H	Data out (DQ ₈ –DQ ₁₅); DQ ₀ –DQ ₇ in High Z	Read	Active
L	H	H	L	L	High Z	Output disabled	Active
L	H	H	H	L	High Z	Output disabled	Active
L	H	H	L	H	High Z	Output disabled	Active
L	L	X	L	L	Data in (DQ ₀ –DQ ₁₅)	Write	Active
L	L	X	H	L	Data in (DQ ₀ –DQ ₇); DQ ₈ –DQ ₁₅ in High Z	Write	Active
L	L	X	L	H	Data in (DQ ₈ –DQ ₁₅); DQ ₀ –DQ ₇ in High Z	Write	Active

Notes

41. Data DQ₀–DQ₇ for × 8 configuration and Data DQ₀–DQ₁₅ for × 16 configuration.

42. BHE and BLE are applicable for × 16 configuration only.

Errata

This section describes the errata for the 8 Mb (2048 K × 8 and 1024 K × 16) nvSRAM product families. Details include errata trigger conditions, scope of impact, available workarounds, and silicon revision applicability.

Contact your local Cypress Sales Representative if you have questions. You can also send your related queries directly to nvSRAM@cypress.com.

Part Numbers Affected

Part Number	Device Characteristics
CY14B108L	1024 K × 8, Asynchronous Interface nvSRAM in 44 TSOP-II and 48 FBGA package options
CY14B108N	512 K × 16, Asynchronous Interface nvSRAM in 54 TSOP-II and 48 FBGA package options

8Mb (1024 K × 8, 512 K × 16) nvSRAM Qualification Status

Production parts.

8Mb (1024 K × 8, 512 K × 16) nvSRAM Errata Summary

The following table defines the errata applicability to available CY14B108L, CY14B108N devices.

Items	Part Number	Silicon Revision	Fix Status
1. AutoStore Disable feature does not work correctly	CY14B108L CY14B108N	Rev 0	None. This issue is applicable to all 8Mb nvSRAM parts in production

1. AutoStore Disable feature does not work correctly

■ Problem Definition

The AutoStore Disable soft sequence disables the AutoStore feature in nvSRAMs. The AutoStore Disable feature is used in applications where data written in the SRAM is not required to be saved automatically on power loss. The 8Mb nvSRAM executes the nonvolatile Store automatically in half the memory (4Mb) even after the AutoStore feature is disabled. The reason is as follows:

The 8Mb nvSRAM uses two dice stack of 4Mb with HSB pin of each die are tied together. Each nvSRAM die in the stacked-die monitors the V_{CC} power independently. When the device V_{CC} fails, the die which detects the V_{CC} dropping below V_{SWITCH} first, internally triggers the power down interrupt and drives its HSB output low. Since the HSB is a bidirectional pin, the low HSB output driven by one die is detected as HSB input by the other die. Therefore, low on the HSB input of other die internally triggers hardware Store and executes unintended nonvolatile Store even though AutoStore was disabled by AutoStore Disable soft sequence.

■ Parameters Affected

None.

■ Trigger Condition(S)

Device V_{CC} power down with nvSRAM AutoStore disable.

■ Scope of Impact

It can corrupt the data in half of the memory by overwriting the existing data in its nonvolatile memory with unintended data.

■ Workaround

None. AutoStore disable feature should not be used in 8Mb nvSRAMs.

■ Fix Status

This issue is applicable to all 8Mb nvSRAM parts in production and will continue serving with errata. There is no plan to fix this issue in the existing parts in production.
