■Filters

Resistor Tunable Filter	SV Series/ SR Series/ SRA Series	4 to 10
BCD Resistor	RD-404	11
Resistor Tunable Filter	HR Series	12 to 15
Resistor Tunable Filter	RT Series	16 to 17
Voltage Tunable Filter	VT Series	18 to 19
Programmable Filter	DT-212 Series	20 to 22
Programmable Filter	DT-408 Series	23 to 26
Programmable Filter	DT-208 Series	27
Programmable Filter	DT-5FL/6FL	28, 29
Programmable Filter	DT-8FL	30, 31
Fixed Frequency Filter	DV Series	32 to 35
Fixed Frequency Filter	CF Series	36 to 38
Band-elimination Filter	SD-1BE	39
200B/S Band Pass Filter	CF-4FPA	40
Low Pass Filter for Wide Band Speech Signals	SF-8FLC-1	41

■Amplifiers

Low Noise FET Amplifier	CA-251F4	42, 43
Low Noise FET Differential Amplifier	CA-451F4	44, 45
Low Noise Amplifier	CA-261F2	46, 47
Low Noise Differential Amplifier	CA-461F2	48, 49
Differential Amplifier	CA-406L2	50, 51
Programmable Gain Amplifier	CA-206L2	52, 53
Binary Latch Adapter	CA-903N	54
High Speed Inverting Amplifier	CA-102R3	55
Low Noise Amplifier	SA Series	56, 57

■Oscillators

Resistor Tunable Oscillator	CG-402	58, 59
Resistor Tunable Oscillator	CG-202	60, 61
Resistor Tunable Oscillator	CG-102/302	62 to 64
Oscillator Adapter	OP-102	65 to 68
Random Binary Generator	CG-742N	69 to 71

■Phase Detectors

Phase Detector	CD-552R3/552R4	72 to 76
Voltage Controlled Phase Shifter	CD-951V4	77 to 79
Phase Detector	CD-505R2	80 to 84

■Dimensions

Dimensional Outline Drawing	85 to 87
-----------------------------------	----------

Filters

LP: Low pass
BW: Band width

HP: High pass
SIP: Single-inline package

BP: Band pass

BE: Band elimination
DIP: Dual-inline package

Model	Type	Order	Roll-off	Attenuation characteristic	Cut-off (center) frequency setting		Dimensions	Refer to
					Range ¹	Control type		
SR-4FL	LP	4	42dB/oct equivalent	Elliptic	40Hz to 100kHz	Resistor tunable	20-pin SIP	p6, p8 to 10
SRA-4FL1	LP	4	42dB/oct equivalent	Elliptic	40Hz to 1.6kHz	Resistor tunable	20-pin SIP	p7 to 10
SV-4FL*	LP	4	42dB/oct equivalent	Elliptic	10Hz to 100kHz	Resistor tunable	15-pin SIP	p4 to 5
SR-4FH	HP	4	42dB/oct equivalent	Elliptic	40Hz to 5kHz	Resistor tunable	20-pin SIP	p6, p8 to 10
SRA-4FH1	HP	4	42dB/oct equivalent	Elliptic	40Hz to 1.6kHz	Resistor tunable	20-pin SIP	p7 to 10
SR-4BL	LP	4	24dB/oct	Butterworth	40Hz to 100kHz	Resistor tunable	20-pin SIP	p6, p8 to 10
SRA-4BL1	LP	4	24dB/oct	Butterworth	40Hz to 1.6kHz	Resistor tunable	20-pin SIP	p7 to 10
SV-4BL*	LP	4	24dB/oct	Butterworth	10Hz to 100kHz	Resistor tunable	15-pin SIP	p4 to 5
SR-4BH	HP	4	24dB/oct	Butterworth	40Hz to 5kHz	Resistor tunable	20-pin SIP	p6, p8 to 10
SRA-4BH1	HP	4	24dB/oct	Butterworth	40Hz to 1.6kHz	Resistor tunable	20-pin SIP	p7 to p10
SR-1BP	BP	2(1-pole pair)	6dB/oct BW	Butterworth	40Hz to 10kHz	Resistor tunable	20-pin SIP	p6, p8 to 10
SR-2BP	BP	4(2-pole pair)	12dB/oct BW	Butterworth	40Hz to 10kHz	Resistor tunable	20-pin SIP	p6, p8 to 10
SRA-2BP1	BP	4(2-pole pair)	12dB/oct BW	Butterworth	40Hz to 1.6kHz	Resistor tunable	20-pin SIP	p7 to 10
SR-2BE	BE	4(2-pole pair)	Max. attenuation: 60dB	Butterworth	40Hz to 10kHz	Resistor tunable	20-pin SIP	p6, p8 to 10
SR-2BLH	LP, HP	2	12dB/oct	Butterworth	40Hz to 100kHz	Resistor tunable	20-pin SIP	p6, p8 to 10

* Supply voltage: 5V, 3.3V single power for SV Series

SF-8FLC-1	LP	8	Max.: -25dB (8kHz), Max.: -50dB (9kHz), Max.: -70dB (14kHz)		7kHz	Frequency fixed	20-pin SIP	p41

*1 Types are determined by the frequency range. E.g.: SR-4FL2 (Type 2) → 400Hz to 20kHz

Some models allow frequency expansion with the adoption of external components.

*2 These filters can be customized to your specifications including the cut-off (center) frequency and filter characteristics that you select from our existing filter characteristics.

Amplifiers

Model	Input configuration	Gain	Frequency	Impedance	Voltage noise (typ.)	Current noise (typ.)	Dimensions	Refer to
CA-251F4	Single-end FET	× 100 fixed	DC to 10MHz	1MΩ	1.4nV/√Hz	150fA/√Hz	20-pin shielded SIP	p42, p43

Resistor Tunable Filter

SV-4BL1 SV-4BL2 SV-4FL1 SV-4FL2

SV series filters are resistor tunable low-pass filters that are powered by 5V or 3.3V of single supply voltage. The setting of cutoff frequency is facilitated with the external resistors (4 pcs.). Butterworth and Elliptic are incorporated into filter characteristics, and the filters fall into two types (Type 1 and Type 2) according to the frequency range. The downsizing of filters has been achieved to actualize a 15-pin single-inline package (SIP).

SV4BL1/2 : 4-pole Butterworth slow pass

SV4FL1/2 : 4-pole elliptic low pass

Model	SV-4BL1	SV-4FL1	SV-4BL2	SV-4FL2
Filter characteristics	Butterworth low pass	Elliptic low pass	Butterworth low pass	Elliptic low pass
Order	4-pole			

▼Absolute maximum ratings

High frequency attenuation (up to 1MHz)	Min. 60dB			

▼Input characteristics

Input impedance	Min. 50kΩ
Maximum input voltage	5V
Minimum input voltage	0V

▼Output characteristics

Output impedance	Max. 100Ω
Maximum output voltage	Min. 4.9V
Minimum output voltage	Max. 100mV
Load resistance	Min. 10kΩ
Voltage noise	Max. 100μVrms
Distortion ⁴	0.01% typ.
Offset voltage ⁵	±30mV typ.
Offset drift	30μV/°C typ.
Mid-potential output accuracy ⁶	±1%

▼Others

Supply voltage	5V (3V to 5.5V)
Quiescent current	10mA typ.
Available temperature/humidity range	−20°C to 70°C, 10 to 95%RH
Storage temperature/humidity range	−30°C to 80°C, 10 to 80%RH
Dimensions	39×15×5.5mm (15pin), Model S15

Note: The following specifications are applied unless otherwise specified: R_F= 31.8kΩ, Power: 5V, Mid-potential: 2.5V, Load: 10kΩ, Ambient temp.: 23±5°C

*1: As to SV series, expansion of the lower cut-off (center) frequency with the external capacitors is disabled. *2: −3dB derived with reference to fc/10 *3: Gain in fc/10

*4: Distortion in fc/10 *5: Drift from mid-potential (adjustable with a trimming resistor) *6: Mid-potential output is a supply voltage/2.

Characteristics

Connection diagram

Example 1 (basic connection)

* This circuit is used for normal connection. Pin 14 needs to be disconnected if no offset calibration is required.

Example 3 (when input and output are AC-coupled)

* This circuit is used to DC-interrupt the prior and subsequent circuits. Pin 14 needs to be disconnected if no offset calibration is required.

Example 2 (when the mid-potential is externally input)

* Noise superimposed in the mid-potential exerts effects on noise characteristics if the mid-potential is externally input.

* If the mid-potential is assigned to the prior and subsequent circuits, this circuit is used. Pin 14 needs to be disconnected if no offset calibration is required.

• Calculation of coupling capacitor

$$\text{Input : } C1 [\mu\text{F}] = \frac{3.18}{f_{ch} [\text{Hz}]}$$

$$\text{Output : } C2 [\mu\text{F}] = \frac{159}{\text{Load} [\text{k}\Omega] \cdot f_{ch} [\text{Hz}]}$$

f_{ch} : Coupling frequency (−3dB)

−6dB is gained in coupling frequency (f_{ch}) if the coupling frequencies for input and output are equal.

f_{ch} : Set at 1/10 or less of cut-off frequency (f_c)

■ Cut-off frequency setting

• Equation of external resistor R_F

$$\text{Type 1 } R_F [\text{k}\Omega] = \frac{15.9 \times 10^3}{f_c [\text{Hz}]}$$

$$\text{Type 2 } R_F [\text{k}\Omega] = \frac{159 \times 10^3}{f_c [\text{Hz}]}$$

Note: Resistance error results in cut-off frequency error and a deterioration of filter characteristics.

Be sure to use a resistor with tolerance of 1%.

R_F : 1.6kΩ to 1.6MΩ

Resistor Tunable Filter

SR-4BL/4FL SR-4BH/4FH SR-2BLH SR-1BP/2BP SR-2BE

SR series filters are ultrasmall resistor tunable filters in single-inline package (SIP). An easy setting of cutoff (center) frequency is assured with the external resistors. The abundance of filter types extends the range of choices.

- SR-4BL1/2/3: 4-pole Butterworth low pass
- SR-4FL1/2/3: 4-pole elliptic low pass
- SR-4BH1/2: 4-pole Butterworth high pass
- SR-4FH1/2: 4-pole elliptic high pass
- SR-2BLH1/2/3: 2-pole Butterworth low/high pass
- SR-1BP1/2: 1-pole pair band pass
- SR-2BP1/2: 2-pole pair band pass
- SR-2BE1/2: 2-pole pair band elimination

*1: As to SR series, expansion of the lower cut-off (center) frequency with the external capacitors (2 or 4 pcs.) is enabled. *2: Gain in frequency (*3): 0dB *3: 4FL, 4BL: fc/10, 4FH: 10fc(fc<3kHz), 3.3fc(fc>3kHz), 4BH: 3.3fc, 2BLH: LPF→fc/10, HPF→10fc(Types 1&2), 3.3fc(Type 3) *4: As to 1BP filter, Q = 10, 20, 30, 40, or 50 is available if a designated pin is connected with GND. Range: 1.81≤Q≤50 if connected with the external resistors *5: Type 3: 1MHz±0, Max. –3dB (HPF) *6: SR-2BLH3 (only): 10V/μs

Resistor Tunable Filter

SRA-4BL1 SRA-4BH1 SRA-4FL1 SRA-4FH1 SRA-2BP1

SRA series filters are power-thrifty resistor tunable filters actualizing the reduction in quiescent current to 1 to 2mA that is 1/10 of the current SR series filters. SRA series filters maintain pin-compatible with SR series filters (see P8) and become capable of operation at min. $\pm 2.5V$ of supply voltage that allows low power consumption as necessary.

Butterworth and elliptic low pass and high pass, and Butterworth band pass are incorporated into filter characteristics. An easy setting of cutoff (center) frequency is assured with the external resistors as with SR series filters, which enables a low-pass expansion with the external capacitors.

Resistor Tunable Filter

HR-4BL HR-4FL HR-4BH HR-4FH HR-2BP

HR series filters are resistor tunable filters that not only realize a wide operating temperature range but ensure high reliability through the adoption of the hermetic seal method and ceramic packaging. An easy setting of cutoff (center) frequency is assured with four external resistors of the same resistance.

4-pole Butterworth and elliptic low pass and high pass, and 2-pole Butterworth band pass are incorporated into filter characteristics.

The setting range of cutoff (center) frequency falls into two types: Type 1 (10Hz to 1.6kHz) and Type 2 (100Hz to 100kHz (50kHz)).

The operating temperature range is selectable, -40°C to 85°C (most of industrial request) or -55°C to 125°C (MIL-STD).

Screening meets MIL-STD and special reliable tests are available on request.

* Critical damage to products is resulted from the application of physical stress that exceeds the absolute maximum ratings. Long-term operation at the maximum ratings leads to considerable degradation in device reliability. The absolute maximum ratings are the rating of stress, which has no assurance of device proper performance under the condition that the specified electrical performance range and maximum ratings are violated.

Resistor Tunable Filter

RT-8FLA1/2 RT-8FLB1/2 RT-3BP1/2

RT series filters are resistor tunable filters that allocate cutoff (center) frequencies with the external resistors (6 or 8 pcs.). RT-8FLA/8FLB low pass filters possess steep attenuation characteristics, which are suited to be used as anti-aliasing filters. RT-3BP 1/3-octave-band pass filter is in conformity with IEC-225 standards.

- 135dB/oct or equivalent: 8-pole Elliptic low pass RT-8FLA

Voltage Tunable Filter

VT-4BLA, VT-4BHA, VT-2BPA

VT-A series filters are capable of controlling frequencies with external voltage and fall into the following three types: 24dB/oct low pass filter (VT-4BLA), 24dB/oct high pass filter (VT-4BHA), and 2-pole pair band pass filter ($Q = 5$; VT-2BPA).

Frequency rises to a maximum as the external control voltage is at the maximum of +10V, which allows the low pass filters to obtain 100kHz and high/band pass filters to obtain 20kHz. The frequency control range has been increased by a factor of 1000 for low/high pass filters and of 100 for band pass filters. The addition of an external capacitor is to vary frequencies to lower.

Model	VT-4BLA	VT-4BHA	VT-2BPA

Basic connection diagram

Equation of external capacitor (C_{EXT})

• VT-4BLA

$$C_{EXT} = \frac{25}{\text{Max. set frequency (Hz)}} - 0.00025(\mu F)$$

• VT-4BHA/2BPA

$$C_{EXT} = \frac{25}{\text{Max. set frequency (Hz)}} - 0.00125(\mu F)$$

* Max. set frequency: Cut-off or center frequency when +10V is assigned to V_c

Note 1: Do not connect an unused pin with other pins.

Note 2: Internal common connection of Pins 2, 22, 36, and 37 is established.

Note 3: C_{EXT} is required only for frequency control of low pass (100Hz or less), high pass (20Hz or less), and band pass (200Hz or less).

Block diagram

■ Configuration of phase linear filter (Bessel)

■ Pinout diagram

Note 1: Do not connect an unused pin with other pins.

Note 2: A black circle (●) on the case top denotes Pin 1.

The phase linear filter is completed with two additional resistors and four capacitors as shown below.

$$C_1 = \frac{17.453}{\text{Max. set frequency (Hz)}} - 0.00025(\mu\text{F})$$

$$C_2 = \frac{15.567}{\text{Max. set frequency (Hz)}} - 0.00125(\mu\text{F})$$

Note: Max. set frequency: 62.2kHz

■ Offset voltage adjustment

With the use of constants provided in the figure, $\pm 50\text{mV}$ of DC offset voltage can be regulated upon voltage output.

■ Control voltage (Vc)

Frequency characteristics of the frequency control circuit are expressed in a flat response between DC and 10kHz. It enables cut-off frequency to vary at several tens μs , which has beneficial effects on dynamic change in frequencies. If noise sources are superposed in control voltage, however, it triggers

potential fluctuations in set frequencies. Small control voltage is susceptible to noise, which may result in the instability of set cut-off frequency. Thorough elimination of noise sources from control voltage is required to regain stable frequency.

(protrusion not included)

Programmable Filter

DT-212D, DT-212DC1, DT-212DC2

DT-212 series filters are regarded as universal filters capable of controlling frequencies with digital signal. The following three types of outputs are to be obtained simultaneously: low pass filter with 12dB/oct of rolloff, high pass filter with 12dB/oct of rolloff, and band pass filter with 6dB/oct of bandwidth. DT-212 series filters facilitate the settings of gain and Q through the adoption of the external resistors, besides the configuration of filters possessing various characteristics and high-order filters.

Frequency is controlled by BCD 3 digits (12 lines). The frequency range falls into three types: 1Hz to 1.599kHz (DT-212DC1), 100Hz to 159.9kHz (DT-212DC2), and a range to be designated with the external capacitors (DT-212D).

▼Filter characteristics

Type	Low pass, high pass, band pass
Order	2 (1-pole pair)
Rolloff	12dB/oct low pass, high pass 6dB/oct • BW band pass
Characteristics	Configuration of any high-order filters available. (with external resistors)
Frequency setting range (fc)	DT-212DC1 : 1Hz to 1.599kHz DT-212DC2 : 100Hz to 159.9kHz DT-212D : Range specified with the external capacitors
Q	Range 1/3 to 1 × 10 ⁶ /fc Setting Set with external resistors.

▼Input characteristics

Impedance	Specified with a gain external resistor. (10kΩ/gain)
Maximum voltage	±10V/gain
Maximum voltage	Same as supply voltage

▼Output characteristics

Impedance	Max. 5Ω
Maximum voltage	±10V(≤100kHz)
Load resistance	Min. 2kΩ
Pass-band gain ^{*1}	Gained with external resistors.
Distortion ^{*2}	0.002%(typ)

Note: The following specifications are applied unless otherwise specified:
Supply voltage: ±15V and +5V, Gain: 1, Q=0.707, Ambient temp.: 23±5°C

Noise	Low pass : 35μVrms(typ) High pass : 100μVrms(typ) Band pass : 30μVrms(typ) (in the 10Hz to 500kHz bandwidth)
Offset voltage	±20mV(typ) Adjustable with an external trimmer potentiometer.
Offset voltage drift	5μV/°C(typ)

▼Cut-off frequency control characteristics

Code	BCD: 3 digits, positive logic (+5V)
Input circuit	CMOS4000 series, pulled down to GND (internal) at 100kΩ
Accuracy	±0.1%(typ)(212D), ±0.5%(typ)(212DC1/2)

▼Built-in operational amplifier

Input bias current	200nA(typ)
f _r	10MHz(typ)
Slew rate	8V/μs(typ)

▼Others

Supply voltage	±15V±10% +5V±10%
Quiescent current	typ : +15mA/-18mA, +2.2mA max: +23mA/-27mA, +3.3mA
Temperature/ humidity range	Operation -20°C to 70°C, 10 to 95%RH Storage -30°C to 80°C, 10 to 80%RH
Dimensions	54.4 × 33.7 × 9.4mm, Type HA

*1: Low pass outputs are DC-coupled. High frequency characteristics of high pass outputs: Max. 500kHz

Block diagram

Pinout diagram

Note *1: Do not connect an unused pin with other pins.

*2: Only external capacitors (C_{EXT}) are available.

*3: A black circle (●) on the case top denotes Pin 1.

Basic connection diagram 2-pole low pass/high pass filters

$$\text{Equation of gain } G_{LP} = G_{HP} = \frac{10}{R_G} \text{ (I/O phase inversion)}$$

$$\text{Equation of } Q = \frac{R_G}{R_Q} \frac{R_Q + 10}{2R_G + 10}$$

$$R_Q = \frac{10R_G}{(2R_G + 10)Q - R_G} \text{ (k}\Omega\text{)}$$

Units: R_G and R_Q in $k\Omega$

E.g.: Determine R_G and R_Q of Butterworth and Bessel characteristics.
(Gain = 2, a 12dB/oct low pass filter assigned)

$$R_G = \frac{10}{G_{LP}} = 5k\Omega$$

$$R_Q = \frac{50}{20Q - 5}$$

$$= 5.469k\Omega \text{ (} Q = 0.70711, \text{ Butterworth)}$$

$$= 7.637k\Omega \text{ (} Q = 0.57735, \text{ Bessel)}$$

Basic connection diagram 1-pole pair band pass filters

$$\text{Equation of gain } G_{BP} = \frac{10}{R_G} \text{ (I/O phase inversion)}$$

$$\text{Equation of } Q = 0.5 + \frac{5}{R_G} + \frac{5}{R_Q}$$

$$R_Q = \frac{10}{2Q - 1 - G_{BP}} \text{ (k}\Omega\text{)}$$

Units: R_G and R_Q in $k\Omega$

E.g.: Determine R_G and R_Q when Q is set at 2, 5, and 10.
(Gain = 5, a 1-pole pair band pass filter assigned)

$$R_G = \frac{10}{G_{BP}} = 2k\Omega$$

$$R_Q = \frac{10}{2Q - 1 - 5}$$

$$= -5k\Omega \text{ (} Q = 2\text{)*}$$

$$= 2.5k\Omega \text{ (} Q = 5\text{)}$$

$$= 0.71k\Omega \text{ (} Q = 10\text{)}$$

* The following specifications should be satisfied:

$Q \geq 3$ is obtained if a gain is "5", and the maximum gain is "3" if Q is set at 2.

Frequency setting

DT-212 series filters allow frequency setting through external contacts or digital signal. The frequency setting (BCD: 3 digits) is completed by assigning weights to the relevant input pins, as shown below. Internal logic reaches “Hi” if +5V is placed to the input pin (bit) and “Lo” if the input pin is set at 0V or open. The sum of bit weights (Hi) denotes frequency, and the frequency (fc) - sum (N) relationship is represented in the following equations.

DT-212DC1	$f_c = N \text{ (Hz)}$
DT-212DC2	$f_c = 100N \text{ (Hz)}$
DT-212D	$f_c = \frac{N}{20 \cdot C_{EXT}} \text{ (Hz)}$ ($C_{EXT} : \mu\text{F}$)

DT-212DC1 built-in capacitor: 50000pF

DT-212DC2 built-in capacitor: 500pF

Operation in TTL level requires a voltage of +3.5 or more and a power of +5 or less when Hi level is placed. If the voltage does not attain +3.5V, connect a proper pull-up resistor to TTL output.

Supply power and GND connection

DT-212 series filters are powered by ±15V and +5V, and also allow a power of +5V to be diverted from +15V.

When only ±15V is supplied

A power of +5V is derived from the connection shown in the following diagram. The Hi level of the logic input signal should be +5.3V at the maximum due to fluctuations in Zener voltage.

The quiescent current for ±15V obtains 22mA (typ) after an increase of 7mA.

Offset voltage adjustment

When low pass or high pass output is used

When band pass output is used

When ±15V and +5V are supplied

The connection of Pins ③⑥ and ③⑦ requires caution to prevent the return current from flowing into the analog circuit from +5V of logic power. Pins ③⑥ and ③⑦ are to be connected on the power side as shown below.

Be sure to use a power of +5V that is small in ripple and pulse noise as with ±15V. The method with the use of only ±15V is adopted if a proper power of +5V fails to be obtained.

Programmable Filter

DT-408D DT-408DC2

DT-408 series filters are universal filters embedded with 2-stage 2-pole state variable filters. These filters facilitate the settings of gain and Q through the adoption of the external resistors, besides the configuration of filters possessing various characteristics and high-order filters.

Frequency is controlled by BCD 2 digits (8 lines). The frequency range falls into the following two types: a range to be designated with the external capacitors (DT-408D) and 1kHz to 159kHz (DT-408DC2).

DT-408 series filters are Type HB (54.4 × 33.7 × 8.0mm) with 40-pin DIP.

▼Filter characteristics

Type	Low pass, high pass, band pass
Order	2 (1-pole pair) × 2
Rolloff	12dB/oct low pass, high pass 6dB/oct • BW band pass
Characteristics	Configuration of any high-order filters available. Max. 4-pole filters per unit
Frequency setting range (fc)	DT-408D : Range specified with the external capacitors DT-408DC2 : 1kHz to 159kHz
Q	Range: 1/3 to 1×10^6 /fc
Setting	Set with external resistors.

Frequency setting

DT-408 series filters allow cut-off (center) frequency setting through external contacts or digital signal. The frequency setting (BCD: 2 digits) is completed by assigning weights to the relevant input pins. Internal logic reaches "Lo" if +0V is placed to the input pin and "Hi" if the input pin is set at +5V or open. The sum of bit weights (Lo) denotes frequency.

The frequency (f_c) - sum (N) relationship is represented in the following equations.

$$\text{DT-408DC2} \quad f_c = N \text{ [kHz]}$$

$$\text{DT-408D} \quad f_c = \frac{N}{2 \cdot C_{EXT}} \text{ [Hz]}$$

Units: C_{EXT} in μF

Application 1-channel 4-pole Butterworth low pass filters

$f_c = 1\text{kHz to } 159\text{kHz}$

Application 1-channel 4-pole Butterworth high pass filters

$f_c = 10\text{Hz to } 1590\text{Hz}$

Application 1-channel 2-pole pair band pass filters

$f_o = 100\text{Hz to } 15.9\text{kHz}$ $Q = 5$

Programmable Filter

DT-208D DT-208DC3

DT-208 series filters are regarded as universal filters capable of controlling frequencies with digital signal (Max. set frequency: 1.59MHz).

The following three types of outputs are to be obtained simultaneously: low pass filter with 12dB/oct of rolloff, high pass filter with 12dB/oct of rolloff, and band pass filter with 6dB/oct of bandwidth. DT-208 series filters facilitate the settings of gain and Q through the adoption of the external resistors, besides the configuration of filters possessing various characteristics and high-order filters.

Frequency is controlled by BCD 2 digits (8 lines). The frequency range falls into the following two types: 10kHz to 1.59MHz (DT-208DC with a built-in capacitor) and a range to be designated with the external capacitors (DT-208D).

▼Filter characteristics

Type	Low pass, high pass, band pass
Order	2 (1-pole pair)
Rolloff	12dB/oct low pass, high pass 6dB/oct • BW band pass
Characteristics	Configuration of any high-order filters available. (Used with high-speed inverter CA-102R3. Established with external resistors.)
Frequency setting range (fc)	DT-208DC3 : 10kHz to 1.59MHz DT-208D : Range specified with the external capacitors
Q	Range 1/3 to $1 \times 10^7/f_c$ Setting Set with external resistors.

▼Input characteristics

Impedance	Specified with a gain external resistor. (2kΩ/gain)
Maximum voltage	±10V/gain
Absolute maximum voltage	Same as supply voltage

▼Output characteristics

Impedance	Max. 5Ω
Maximum voltage	±10V(≤1MHz)
Load resistance	Min. 2kΩ
Pass-band gain	Gained with external resistors.
Distortion	0.02% (typ)
Noise	60μVrms (typ) Low pass output (in the 10Hz to 500kHz bandwidth)
Offset voltage	±30mV (typ) Adjustable with an external trimmer potentiometer.

▼Cut-off frequency control characteristics

Code	BCD: 2 digits, negative logic
Input circuit	CMOS input, pulled up to +5V at 100kΩ (internal)
Accuracy	DT-208D : ±0.25% (typ), DT-208DC3 : 0.5% (typ)

▼Others

Supply voltage	±15V (±14 to ±16)
Quiescent current	±50mA(typ)
Temperature/humidity range	Operation -20°C to 70°C, 10 to 95%RH Storage -30°C to 80°C, 10 to 80%RH
Dimensions	54.4 × 33.7 × 9.4mm, Type HA

Note: The following specifications are applied unless otherwise specified:
23±5°C, Vs = ±15V

Block diagram

Basic connection diagram

• DT-208 low pass/high pass filters

$$\text{Gain} = \frac{2 \times 10^3}{R_G [\Omega]} \quad R_Q [W] = \frac{R_{BP} [\Omega]}{3Q - 1} \quad (\text{I/O phase inversion})$$

• DT-208 band pass filters

$$\text{Gain} = \frac{R_{BP} [\Omega]}{R_G [\Omega]} \quad R_Q [\Omega] = \frac{R_{BP} [\Omega]}{2(Q - 1)} \quad (\text{I/O phase inversion})$$

■Determination of Cf (DT-208D)

DT-208D filters possess no frequency-determining capacitor, which requires the installation of external Cf.

The sum of bit weights when logic is controlled to "Lo" is expressed in "N".

$$f_c [\text{Hz}] = \frac{N}{4 \times 10^5 \times C_F [\text{F}]}$$

$$C_F [\text{F}] = 2.5 \times 10^{-6} \times \frac{N}{f_c [\text{Hz}]}$$

E.g.: When logic (N) is 100 :

To obtain 1MHz in fc, 250pF (Cf) is pre-assigned to DT-208D (DT-208DC3 has an internal Cf of 250pF).

The configuration of the Elliptic filters and band elimination filters with the use of DT-208 series filters requires the combination use of High-Speed Inverting Amplifier CA-102R3. See Page 55 for further information on CA-102R3.

Programmable Filter

DT-5FL1/2 DT-6FL1/2

DT-5FL/6FL series filters are low pass filters possessing steep attenuation characteristics, which are intended for anti-aliasing at A/D conversion. These filters allow cut-off frequency to be shifted at 8 positions with digital signal, which are suitable for frequent shift in sampling frequency.

60dB/oct or equivalent: 5-pole elliptic low pass DT-5FL1/2

Fixed Frequency Filter

DV series

DV series filters are semi-custom-designed fixed frequency filters that allow customers to select desirable attenuation characteristics from our various existing characteristics. These filters can be customized to your specifications including the cut-off frequency (fc), center frequency (fo), and selectivity (Q).

DV series model and order specifications

Model

E.g.: DV-3BL-DC denotes a 3-pole Butterworth DC-coupled low pass filter.

Order specifications (Model and the following items are required for an order for customization.)

Filter type	Specifications	Remarks
High pass filter	• Cut-off frequency	−3dB
Low pass filter		
Narrow band pass filter	• Center frequency • Q	$Q = \frac{\text{Center frequency}}{\text{3dB bandwidth}}$
Wide band pass filter	• Upper limit frequency (fcH) • Lower limit frequency (fcL)	−3dB each Note that fcH/fcL limits are imposed.
Band elimination filter	Center frequency	

- Partial modification to standard filters and customized filters
Partial modification to standard filters is available as listed below. Custom making on filters is also available by special order. Contact us for further information.
- Supply voltage of +24V is modified to ±15V.
- Wide-band pass filter is rendered with different attenuation characteristics between high pass and low pass.
- Q of band elimination filters is set at any number other than 5.

Note: The following specifications are applied unless otherwise specified: 23 $\pm 5^\circ$ C

Characteristics

Precautions for use

●DC voltage is applied to the input/output terminals in 24-volt filters and ± 15 -volt modified filters, which requires the interruption of DC voltage with a capacitor to use the relevant filters. The capacitor capacity is derived from the following equation with min. 10k Ω of load applied. The proper polarity of the capacitor (see the following figure) and withstand pressure should be assured.

A. Low pass filters

Note that the lower limit (f_L) of the pass band is determined.

$$C_{IN} = \frac{32}{f_L} \text{ (}\mu\text{F)} \quad C_{OUT} = 5 \times C_{IN} \text{ (}\mu\text{F)}$$

A reduction in f_L level is limited to 0.1dB if the above value is assigned, and 12dB/oct is obtained for the reduced rolloff.

B. High pass filters

Cut-off frequency determined by the capacitor should be 1/20 of f_c at the maximum. The following equation is used to obtain the value.

$$C_{IN} = \frac{64}{f_L} \text{ (}\mu\text{F)} \quad C_{OUT} = 5 \times C_{IN} \text{ (}\mu\text{F)}$$

High pass frequency characteristics: Max. 1MHz at output of 2Vrms

C. Band pass filters

The equation at "B. High pass filters" is also applied to derive wide band pass filters (with f_{CL} and f_{CH} specified).

●Be sure to use a stable power that is small in ripple and noise. Potential degradation in filter characteristics and distortion and potential reduction in the maximum input level may be concerned if the voltage that is out of the specifications (Max. 2mVp-p for ± 15 V filters, and Max. 0.5mVp-p for +24V filters and ± 15 V modified filters) is applied.

Multichannel filter DV-04/04B

This case, which is outfitted with DC power for DV filter drive, is designed to use DV filters on the desktop. It is capable of storing up to 4 DV filters*. DV-04 is designed for Types L/ML/NL, and DV-04B supports Type B (± 15 V, DC-coupled filters). CF series filters (see Page 36) can also be embedded in DV-04 with the use of the CF/DV conversion adapter.

* The maximum quiescent current may impose limits on the number of filters to be stored.

Available filters	Max. 4 DV filters*, Types L/ML/NL, CF series (CF/DV conversion adapter used): DV-04 for Type B: DV-04B
Max. quiescent current	40mA/1 channel: (DV-04) 140mA/4 channels: (DV-04B)
I/O terminals	BNC-R
Supply voltage	AC100V $\pm 10\%$ 50/60Hz
Dimensions	225 (W) $\times$ 67(H) $\times$ 250(D)mm (protrusion not included)

A multichannel filter with DC power supply is also available by special order. Contact us for further information.

Fixed Frequency Filter

CF series

CF series filters are semi-custom-designed fixed frequency filters that allow customers to select desirable characteristics from our various existing standard filter characteristics. These filters can be customized to your specifications including the cut-off frequency, center frequency, and selectivity (Q), which requires no external components. Customization is also enabled in accordance with the relevant characteristics plot and transfer functions other than filter characteristics.

Not only the prominent downsizing but the weight reduction of filters has been actualized by capitalizing on surface mount technology, as compared with the current DV series filters.

CF series filters can also be embedded in DV-04 (see Page 35) with the use of the CF/DV conversion adapter. Integration of CF series filters carrying 40mA or more of quiescent current is disabled due to limits on the DV-04 current capacity.

Characteristics

Customization is also enabled in accordance with the relevant characteristics plot and transfer functions if no intended characteristics are observed in standard filter characteristics or no specific model is provided.

Band Elimination Filter

SD-1BE

SD-1BE filter is a low-powered hybrid IC 1-pole pair band elimination filter. Mode selection is available under digital control, FILT mode or THRU mode. FILT mode can be placed at 50Hz or 60Hz of center frequency, and the rolloff is controlled to remain 24dB or more even if $\pm 1\%$ is shifted from center frequency.

The offset voltage is internally adjusted to 10mV or lower in both THRU and FILT modes. The downsizing has been achieved to actualize a 20-pin single-inline package (SIP).

Characteristics

200B/S Band Pass Filter

CF-4FPA

CF-4FPA filter is a band pass filter designed for a 200B/S modem. This filter possesses frequencies falling into the following six types: 800, 1200, 1600, 2000, 2400, and 2800Hz. The downsizing has been achieved to actualize a 40-pin dual-inline package in dimensions of 54.4 × 33.7 × 6.5mm.

▼ Absolute maximum ratings

Supply voltage ($\pm V_s$)	$\pm 18V$
Input voltage	$\pm V_s$

▼ Filter characteristics

Filter characteristics	4-pole Elliptic BPF
------------------------	---------------------

▼ Center frequency (fo)

Center frequency	800, 1200, 1600, 2000, 2400, 2800Hz (nominal value)
------------------	---

▼ Pass-band characteristics

Gain	$0 \pm 1\text{dB}$ (fo)
Pass-band ripple	$0 \pm 1\text{dB}$ (fo $\pm 100\text{Hz}$, fo = 0dB)

▼ Attenuation

Attenuation	Min. 15dB (fo $\pm 200\text{Hz}$) Min. 45dB (fo $\pm 300\text{Hz}$)
-------------	--

▼ Distortion

Distortion	Max. 0.1% (3Vrms applied)
------------	---------------------------

▼ Input characteristics

Impedance	Min. 50k Ω
Maximum voltage	$\pm 10V$
Maximum voltage	Same as supply voltage

▼ Output characteristics

Impedance	Max. 100 Ω
Load resistance	Min. 10k Ω
Max. output voltage	$\pm 10V$
Noise	Max. 140 μVrms (BW: 10Hz to 500kHz)
Offset voltage	$\pm 20\text{mV}$ (typ)

▼ Others

Supply voltage	$\pm 15V$ (± 5 to $\pm 16.5V$ operational)
Quiescent current	$\pm 28\text{mA}$ (typ) (Max. $\pm 42\text{mA}$)
Temperature/Operation	-20°C to 70°C , 10 to 95%RH
humidity range/Storage	-30°C to 80°C , 10 to 80%RH
Dimensions	54.4 × 33.7 × 6.5mm, Type H

Note: The following specifications are applied unless otherwise specified: $23 \pm 5^\circ\text{C}$, $V_s = \pm 15V$

Low Pass Filter for Wide Band Speech Signals

SF-8FLC-1 compliant with CCITT Rec.G.722

SF-8FLC-1 filter is a low pass filter intended for anti-aliasing of terminal equipment in a 64kbit/sec of wideband transmission network. This filter possesses steep attenuation characteristics such as -25dB at 8kHz, -50dB at 9kHz, and -70dB at 14kHz despite 7kHz of cut-off frequency.

Not only the prominent downsizing but the weight reduction of the filter has been realized to achieve a 20-pin single-inline package in dimensions of 51.5 × 14.0 × 5.5mm.

Filter characteristics

Filter characteristics	Compliant with CCITT Rec.G.722.
Pass-band gain	±0.5dB (1kHz, 10kΩ of load)
Amplitude characteristics (1kHz = 0dB)	+0/-1.5dB (50Hz), ±0.5dB (100Hz), +0.5dB (6.4kHz), +0.5/-1.5dB (7kHz), Max. -25dB (8kHz), Max. -50dB (9kHz), Max. -70dB (14kHz)
Fixed delay	Max. 2ms (minimum pass band)
Group delay response	Max. 1ms (50Hz), Max. 500μs (100Hz), Max. 125μs (200Hz), Max. 125μs (4kHz), Max. 500μs (6.4kHz), Max. 1ms (7kHz) (Fixed delay = 0s)

Input characteristics

Input impedance	Min. 50kΩ
Maximum voltage	±10V

Output characteristics

Output impedance	Max. 100Ω
Max. output voltage	±10V
Load impedance	Max. 10kΩ
Noise	Max. 140μVrms (BW: 10Hz to 500kHz)
Offset voltage	±30mV (typ)

Others

Supply voltage/current	±15V ±10%, ±32mA (typ)
Temperature/humidity range	Operation -20°C to 70°C, 10 to 95%RH Storage -30°C to 80°C, 10 to 80%RH
Dimensions	51.5 × 14.0 × 5.5mm, Type S20

Note: The following specifications are applied unless otherwise specified:
23±5°C, Vs = ±15V

Low Noise Amplifier

CA-251F4

CA-251F4 amplifier is a low noise amplifier allocated with bandwidth of DC to 10MHz. With substantially low noise maintained, outstanding DC characteristics and frequency characteristics have been actualized through the adoption of the noise reduction circuit that is the application of the negative feedback technology. Our original 6-surface-shielded single-inline package is a great contributor to the implementation of high precision signal processing and high density mounting. CA-251F4 is powered by $\pm 15V$, and its gain is 40dB.

▼ Absolute maximum ratings

Supply voltage ($\pm V_s$)	$\pm 16.5V$
Signal input voltage	$\pm 1V, \pm 0.5V$ (with no power supplied)
Offset input voltage	$\pm V_s$

▼ Input

Input form	DC coupling, unbalanced single ended input
Input impedance	$1M\Omega \pm 5\%$ (DC, Pins ① and ② connected, Shunt capacitance: 55pF (typ))
Linear maximum input voltage	$\pm 100mV$ (at 1kHz)
Input bias current	$\pm 30pA$ (typ)
Input voltage noise density	Max. $1.8nV/\sqrt{Hz}$ (at 10kHz, short-circuit in input terminal) $1.4nV/\sqrt{Hz}$ (typ) (at 10kHz, short-circuit in input terminal)
Input current noise density	$150fA/\sqrt{Hz}$ (typ) (at 1kHz)
Input offset voltage	$\pm 50\mu V$ (typ) (short-circuit in input terminal) Zero adjustment available with an external trimmer potentiometer.
Input DC drift	$\pm 2\mu V/^\circ C$ (typ) (short-circuit input terminal) 0 to $40^\circ C$

▼ Output

Output form	DC coupling, unbalanced single ended output
Maximum output voltage	$\pm 10V$ (at 1kHz, load resistance $\geq 1k\Omega$)
Maximum output current	$\pm 10mA$
Slew rate	$110V/\mu s$ (typ)
Output impedance	$50\Omega \pm 5\%$ (DC)

▼ Amplifier

Voltage gain	$40 \pm 0.2dB$ (at 1kHz)
Voltage gain frequency characteristics	DC to 10MHz (+0.5/-3dB)
I/O phase	In-phase
Harmonics distortion	0.006% (typ) (at 1kHz, $\pm 10V$ output)

▼ Power supply

Recommended power supply voltage range	$\pm 15V \pm 1V$
Quiescent current	$\pm 30mA, \pm 25mA$ (typ)

▼ Environment

Specified temperature range	$23 \pm 5^\circ C$
Temperature/humidity range	Operation: $-20^\circ C$ to $70^\circ C$, 10 to 90%RH Storage: $-30^\circ C$ to $80^\circ C$, 10 to 80%RH

▼ Dimensions

Type	Type SS20 (20-pin shielded SIP)
Dimensions	$67 \times 10.5 \times 20mm$ (protrusion not included)
Weight (NET)	Approx. 20g

Note: The following specifications are applied unless otherwise specified: $23 \pm 5^\circ C$, Supply voltage: $\pm 15V$, Load resistance: $1M\Omega$

Basic connection diagram

Block diagram

Characteristics

Notes

Proper connection between the case ground and the GND potential should always be assured. No sufficient shielding effect is produced if disregarded.

No signal traces should be assigned on the maximum visible outline of the component mounting surface. Possible contact between the metal case and the board is observed around the maximum visible outline, which triggers the establishment of a short circuit between the signal and case. A ground plane pattern is recommended to incorporate into the maximum visible outline and the inside of the case to enhance shielding effect.

- The maximum input voltage is $\pm 0.5V$ when the module is not in action (no power being supplied). Potential damage to the module may be concerned if the maximum voltage is violated. If a voltage of $\pm 0.5V$ or more is input, a protective circuit is inserted into the input terminal.
- The maximum input amplitude is $\pm 1V$ when the module is in action. If signal amplitude of $\pm 1V$ or more is input, a protective circuit is inserted into the input terminal.
- The series regulator type power supply is required to ensure low noise. Switching noise lies in the switching regulator type power supply such as a DC-DC converter, which impairs low noise in the module.

Evaluation board

A module-mounted evaluation board is available for easy evaluation of this module. Contact us for further information.

Low Noise FET Differential Amplifier

CA-451F4

CA-451F4 amplifier is a FET input low noise differential amplifier, which ensures not only $2.5\text{nV}/\sqrt{\text{Hz}}$ of input voltage noise density but $\times 100$ voltage gain. With substantially low noise maintained, outstanding DC characteristics ($2\mu\text{V}/^\circ\text{C}$) and frequency characteristics (DC to 10MHz) have been actualized through the adoption of the noise reduction circuit that is the application of the negative feedback technology. FET input is incorporated into CA-451F4 amplifier, which delivers low noise characteristics up to high signal source impedance ($100\text{k}\Omega$). Our original 6-surface-shielded 20-pin single-inline package is a great contributor to the implementation of high precision signal processing and high density mounting.

▼Absolute maximum ratings

Supply voltage ($\pm V_s$)		$\pm 16.5V$
Signal input voltage	Differential input	$\pm 1V, \pm 0.7V$ (with no power supplied)
	Common mode input	$\pm V_s, \pm 0.7V$ (with no power supplied)
Offset input voltage		$\pm V_s$

▼Input

Input form	DC coupling, differential input
Differential input impedance	$2\text{G}\Omega$ (typ) (DC, single ended) Shunt capacitance: 22pF (typ)
Common mode input impedance	$1\text{G}\Omega$ (typ) (DC) Shunt capacitance: 44pF (typ)
Linear maximum differential input voltage	$\pm 100\text{mV}$ (at 1kHz)
Linear maximum common mode input voltage	$\pm 5\text{V}$ (at 1kHz)
Input bias current	$\pm 50\text{pA}$ (typ)
Input offset current	$\pm 10\text{pA}$ (typ)
CMRR (RTI)	110dB (at 60Hz) 70dB (typ) (at 1MHz)
Input voltage noise density	Max. $3\text{nV}/\sqrt{\text{Hz}}$ (at 10kHz) $2.5\text{nV}/\sqrt{\text{Hz}}$ (typ) (at 10kHz)
Input current noise density	$100\text{fA}/\sqrt{\text{Hz}}$ (typ) (at 1kHz)
Input offset voltage	$\pm 50\mu\text{V}$ (typ) (short-circuit in input terminal) Zero adjustment available with an external trimmer potentiometer.
Input DC drift	$\pm 2\mu\text{V}/^\circ\text{C}$ (typ) (short-circuit in input terminal) 0 to 40°C

▼Output

Output form	DC coupling, single ended output
Maximum output voltage	$\pm 10\text{V}$ (at 1kHz , load resistance $\geq 1\text{k}\Omega$)
Maximum output current	$\pm 10\text{mA}$
Slew rate	$110\text{V}/\mu\text{s}$ (typ)
Output impedance	$50\Omega \pm 5\%$ (DC)

Differential Amplifier

CA-406L2

CA-406L2 amplifier is a low noise differential amplifier capable of logical setting of gains ($\times 1$ to $\times 100$) in accordance with 1-, 2-, or 5-sequence. Frequency characteristics are expressed in a flat response till 50kHz. A gain accuracy is limited to 0.1% (typ), and a superior common mode rejection ratio of 100dB (typ) is assured. Gain setting is completed by controlling the 6 control terminals (1, 2, 5, 10, $\times 1$, $\times 10$) according to TTL or CMOS negative logic. CA-406L2 amplifier is a 20-pin single-inline package, which enables high density mount-ing.

▼Absolute maximum ratings

Supply voltage ($\pm V_s$)	$\pm 18V$
Signal input voltage	$\pm V_s$
Control voltage	+5.5V, -0.5V

▼Gain

Gain	1, 2, 5, 10, 20, 50, $\times 100$
Accuracy	$\pm 0.1\%$ (typ)

▼Input characteristics

Input form	Differential input
Impedance	$3 \times 10^{10} \Omega / 8pF$ (typ) (for differential and common input)
Common mode voltage	$\pm 10V$
Common mode rejection ratio	Min. 90dB (DC to 60Hz: $G = 100$)
Offset voltage	$\pm 2mV$ (typ) (RTI, $G = 100$, input grounding)
Offset drift	$\pm 25 \mu V / ^\circ C$ (typ) (RTI, $G = 100$, input grounding)
Voltage noise density	$27nV / \sqrt{Hz}$ (typ) (RTI, $G = 100$, input grounding)

▼Frequency characteristics

$\pm 3dB$ flat (small signal)	Min. DC to 200kHz
$\pm 1\%$ flat (small signal)	DC to 50kHz (typ)
Full power bandwidth	DC to 100kHz (typ)
Slew rate	$20V / \mu s$ (typ)

▼Output characteristics

Maximum voltage	$\pm 10V$
Maximum current	$\pm 5mA$
Impedance	Max. $5k\Omega$
Load resistance	Min. $2k\Omega$

▼Control characteristics

Control line	1, 2, 5, 10, $\times 1$, $\times 10$
Level	TTL or CMOS negative logic
Level input process	Pulled up to +5V (internal) at $100k\Omega$

▼Others

Supply voltage	$\pm 15V$ (± 14 to $16V$)
Quiescent current	$+15mA$, $-12mA$ (typ)
Temperature/ humidity range	Operation: $-20^\circ C$ to $70^\circ C$, 10 to 95%RH Storage: $-30^\circ C$ to $80^\circ C$, 10 to 80%RH
Dimensions	$51.5 \times 14 \times 6.5mm$, Type S20

Programmable Gain Amplifier

CA-206L2

CA-206L2 amplifier is a low noise DC amplifier capable of logical setting of gains ($\times 1$ to $\times 100$) in accordance with 1-, 2-, or 5-sequence. Frequency characteristics are expressed in a flat response till 100kHz. A gain error is limited to 0.1% (typ) that denotes high accuracy. Gain setting is completed by controlling the 6 control terminals (1, 2, 5, 10, $\times 1$, $\times 10$) according to TTL or CMOS IC negative logic.

Easy gain setting with the use of 3-bit binary signal or binary code switch is assured if the amplifier is connected with the binary latch adapter CA-903N. The latch function enables direct connection to CPU. CA-206L2/CA-903N amplifiers are 20-pin single inline package, which enables high density mounting.

▼ Absolute maximum ratings

Supply voltage ($\pm V_s$)	$\pm 18V$
Signal input voltage	$\pm V_s$
Control voltage	+5.5V, -0.5V

▼ Gain

Gain (G)	1, 2, 5, 10, 20, 50, $\times 100$ Error: $\pm 0.1\%$ (typ), Max. $\pm 0.4\%$ (1kHz)
Setting	6 control terminals (1, 2, 5, 10, $\times 1$, $\times 10$) used

▼ Input characteristics

Input form	Unbalanced
Input impedance	$1M\Omega \pm 2\%$ (1kHz)
Max. input voltage (linear)	$\pm 10V$ (G = 1)
Offset voltage	$\pm 1mV$ (typ) (RTI, G = 100, input grounding) Offset voltages of the input/output amplifiers: Adjustable with external trimmer potentiometer (2 pcs.).
Offset drift	$\pm 20\mu V/^\circ C$ (typ) (RTI, G = 100, input grounding)
Voltage noise density	$7nV/\sqrt{Hz}$ (typ) (RTI, G = 100, input grounding)

▼ Frequency characteristics

$\pm 3dB$ flat (small signal)	Min. DC to 500kHz
$\pm 1\%$ flat (small signal)	DC to 100kHz (typ)
Full power bandwidth	DC to 100kHz (typ)
Slew rate	$10V/\mu s$ (typ)

▼ Output characteristics

Maximum output	Voltage: $\pm 10V$, Current: $\pm 5mA$
Load resistance	Min. $2k\Omega$
Output impedance	Max. $5k\Omega$

▼ Control characteristics

Control line	1, 2, 5, 10, $\times 1$, $\times 10$
Level	TTL or CMOS negative logic
Level input process	Pulled up to +5V (internal) at 100k Ω

▼ Others

Supply voltage	$\pm 15V$ (± 14 to $16V$)
Quiescent current	+15mA (typ), -20mA (max)
Temperature/operation	$-20^\circ C$ to $70^\circ C$, 10 to 95%RH
humidity range/storage	$-30^\circ C$ to $80^\circ C$, 10 to 80%RH
Dimensions	$51.5 \times 14 \times 6.5mm$, Type S20

Note: The following specifications are applied unless otherwise specified: $23 \pm 5^\circ C$, $V_s = \pm 15V$

Binary Latch Adapter

CA-903N

CA-903N adapter is endowed with outstanding features including gain setting by binary code that is available if connected to CA-206L2 programmable gain amplifier or CA-406L2 differential amplifier. This adapter is also capable of actuating the latch function.

Gain setting binary code input becomes valid if the latch control input terminal is open or set at +5V, which allows gain setting by the negative logic level signal. Latch control input needs to be set at 0V to exert the latch function, which enables data on gain setting binary code input to be latched at the edge of 0V.

Connection with CA-206L2 and CA-406L2 amplifiers is established with the same-numbered pins (8 pcs.), and the power is supplied.

▼Absolute maximum ratings

Supply voltage ($\pm V_s$)	+5.5V
Control voltage	+5.5V, -0.5V

High Speed Inverting Amplifier

CA-102R3

CA-102R3 amplifier is designed for inverting amplification that is capable of gain setting with the external resistors (2 pcs.). 10MHz at -3dB, 1MHz at full power, and 200V/ μ s of slew rate are obtained in frequency of small signal if a gain is "1". The maximum output voltage is ± 10 V, and the maximum output current is 10mA. This amplifier is suited to be used as an adder to produce an attenuation pole for the configuration of an elliptic filter that is the application of DT-208D series filters. CA-102R3 amplifier has the advantage of superior frequency characteristics and compact size that expands a wide range of applications.

▼ Amplification characteristics

Gain	Gained with external resistors (2 pcs.). (R_{IN} , R_{NF}) $GAIN = \frac{R_{NF}}{R_{IN}}$
Frequency characteristics	Full power: DC to 1MHz Small signal: DC to 10MHz ($\pm 3dB$)
Slew rate	200V/ μs (typ)

▼Input characteristics

Impedance	R_{IN}
Max. input voltage	$\pm 10V$

▼Output characteristics

Impedance	Max. 5Ω
Max. output voltage	±10V
Max. output current	±10mA
Offset voltage	±7mV (typ)

▼Others

Low Noise Amplifier

SA-220F5 SA-230F5 SA-430F5 SA-200F3 SA-400F3

SA series amplifiers are preamplifiers for submicro-signal detection, which have been developed to assure noise reduction never before accomplished. 5 types of SA series amplifiers, which vary by a frequency band, input form, and input impedance, are available. Not only the dedicated power supply but the sensor control power supply is offered for outstanding noise reduction.

SA series amplifiers have actualized low noise featuring the following items through the adoption of our original circuit that is the application of the negative feedback technology: 50Ω of input impedance, 0.6dB of noise figure (SA-230F5), 0.5nV/√Hz of input voltage noise at 100kΩ (SA-200F3), and 200fA/√Hz of input voltage noise at 1MΩ (SA-220F5).

■ DC power supply: SA-915D1

SA-915D1 power supply is to supply DC power, which is intended for SA series amplifiers, for reductions in noise and ripple. The innovative way to fight the noise has been taken in this power supply. The combination use of a SA series amplifier and SA-915D1 power supply is suggested to assure outstanding performance.

▼ Output

Output form	Mini DIN, 4-pin connector
Output voltage	±15V ±3%
Maximum output current	±100mA
Output voltage noise/ripple	Max. 300μVrms (BW: 10Hz to 20MHz)
Output voltage temperature coefficient	500ppm/°C typ

▼ Others

Power supply	AC100V ±10%, 48Hz to 62Hz Approx. 10VA
Dimensions	120×55×200mm (protrusion not included)
Weight (NET)	Approx. 1.4kg
Operating temperature/humidity range	0°C to 40°C, 10 to 95%RH (no condensation)
Storage temperature/humidity range	-0°C to 50°C, 10 to 80%RH (no condensation)

Note: The following specifications are applied unless otherwise specified: 23±5°C, AC100V, Load resistance: 150Ω

■ DC bias supply: SA-912S1

SA-912S1 power supply is a bias power supply for sensors that process micro-signals.

This power supply is composed of a dual-redundant regulator, special noise filter circuit, dual transformers, and dual shield chassis, which offers excellent noise reduction.

▼ Output

Output form	Mini DIN, 4-pin connector
Output voltage	±12V ±3% (no load)
Maximum output current	±100mA
Output voltage noise/ripple	Max. 3μVrms (BW: 10Hz to 1MHz)
Output voltage temperature coefficient	300ppm/°C typ

Frequency setting	Specified with external resistors (2 pcs.).	
Frequency accuracy ^{*2}	±5%, ±2% (typ)	
Frequency stability	±50ppm/°C (typ)	
Output voltage	2.5Vrms±5% ^{*3}	
Output voltage stability	100ppm/°C (typ)	
Output impedance	Max. 5Ω	
Load impedance	Min. 2kΩ	
Distortion	Max. 0.1% (200Hz to 10kHz)	
Supply voltage	±15V±10%	
Quiescent current (typ)	±8mA	12mA
Temperature/ humidity range	Operation	−20°C to 70°C, 10 to 95%RH
	Storage	−30°C to 80°C, 10 to 80%RH
Dimensions	32×14.0×5.5mm, Type S12	

Note: The following specifications are applied unless otherwise specified:
23±5°C, ±15V, R_F = 15.9kΩ

*1. Expansion of the lower frequency is enabled.

*2. Errors of external resistors are excluded.

*3. Available at ±2 to ±10V. Max. output: ±10V, ±5mA
(402R1: 20Hz to 10kHz, 402R2: 1kHz to 50kHz)

Basic connection diagram

Output voltage

Pins ⑩ – ⑪ shorted: ±10V

Pins ⑪ – ⑫ shorted: ±2V

Block diagram

Frequency setting

Equation of external resistor

$$\text{CG-402R1} \quad R_F = \frac{15.9 \times 10^3}{f_o} \text{ (k}\Omega\text{)}$$

$$\text{CG-402R2} \quad R_F = \frac{159 \times 10^3}{f_o} \text{ (k}\Omega\text{)}$$

Note: f_o: Oscillation frequency

Units: f_o in Hz

Frequency setting requires 2 external resistors of the same resistance.

Be sure to use resistors with relative tolerance of 1% to ensure optimal internal operation.

Expansion of the lower frequency range (10Hz to 20Hz)

Equation of external resistor

$$\text{CG-402R1} \quad R_F = \frac{15.9 \times 10^3}{f_o} \text{ (k}\Omega\text{)}$$

Note: f_o: Oscillation frequency

Units: f_o in Hz

Output voltage setting

2.5Vrms of output voltage is obtained if Pins ⑩ and ⑪ are open, but output voltage varies as follows: $\pm 10V$ (approx. 7Vrms) when Pins ⑩-⑪ are shorted and $\pm 2V$ (approx. 1.4Vrms) when Pins ⑪-⑫ are shorted. An external resistor is required for setting output voltage (1.4 to 7Vrms) other than the above. The graph at the right expresses the standard values of external resistor and output voltage. Adjustment with a variable resistor is required to derive correct voltage.

When load capacity is large

Potential unstable and abnormal oscillation may be concerned if 100pF or more of load capacity is observed. With a coaxial cable or shielding wire put under load, overload capacity is detected in some oscillators a load capacity if the cable or

wire reaches a length in excess of 50cm. In the event of the above, a 50Ω-resistor or buffer amplifier needs to be inserted between the relevant oscillator and load.

Characteristics

Resistor Tunable Oscillator

CG-202R3

CG-202R3 oscillator is a sine-wave oscillator capable of allocating oscillation frequency in the range of 100kHz to 1MHz. This oscillator not only possesses superior frequency accuracy and output voltage accuracy but also assures stable sine-wave signals. CG-202R3 oscillator is in 24-pin dual in-line package, which enables a low-pass expansion up to 10Hz with the external capacitors and capacitor.

Frequency range ^{*1}	100kHz to 1MHz
Frequency setting	Specified with external resistors (2 pcs.).
Frequency accuracy ^{*2}	Max. ±5%, ±2% (typ)
Frequency stability	±50ppm/°C (typ)

Resistor Tunable Oscillator

CG-102R1/2 CG-302R1/2

CG-102/302 series oscillators are sine-wave oscillators capable of allocating oscillation frequency in the 20- to 100kHz range. This oscillator not only possesses superior frequency accuracy and output voltage accuracy but also assures stable sine-wave signals. An additional input terminal is embedded in CG-102/302 series oscillators for output with 90°-phase lag and sync oscillation, which expands applicability. With the use of the external capacitors and capacitor, a low-pass expansion up to 1Hz is enabled.

CG-102 series oscillators are in 24-pin dual-inline package, and CG-302 series oscillators are in 20-pin single-inline package.

Note: The following specifications are applied unless otherwise specified:
23±5°C, ±15V, R_F = 15.9kΩ

*1. Expansion of the lower frequency is enabled.

*2. Errors of external resistors are excluded.

*3. Available at 0.5 to 20Vp-p. Max. output: ±10V, ±5mA
(CG-102R1/302R1: 20Hz to 10kHz, CG-102R2/302R2: 1kHz to 50kHz)

Basic connection diagram

Block diagram

Frequency setting

Equation of external resistor

$$\begin{array}{l} \text{CG-102R1} \\ \text{CG-302R1} \end{array} \quad R_F = \frac{15.9 \times 10^3}{f_o} \text{ (k}\Omega\text{)}$$

$$\begin{array}{l} \text{CG-102R2} \\ \text{CG-302R2} \end{array} \quad R_F = \frac{159 \times 10^3}{f_o} \text{ (k}\Omega\text{)}$$

Note: f_o : Oscillation frequency
Units: f_o in Hz

Frequency setting requires 2 external resistors of the same resistance.

An accuracy between the external resistors causes fluctuations in output level.

E.g.: Max. $\pm 0.5\%$ of difference between outputs 1 and 2 if a resistor with tolerance of 1% is used

Output voltage adjustment

CG-102 series oscillators are designed to obtain 20Vp-p of output voltage if Pins ⑫ and ⑭ are shorted, and CG-302 series oscillators are designed to obtain the same voltage if Pins ⑩ and ⑪ are shorted. 2.5Vrms of output voltage is obtained if CG-102/302 oscillators are open.

An external resistor is required for setting output voltage other than the above. The graphs as shown below express the standard values of external resistor and output voltage. Adjustment with a variable resistor is required to derive correct voltage.

● To set the voltage at 1.5Vrms or less

● To set the voltage at 1.5Vrms or more

Note: Output voltage: Max. 2.5Vrms if 10kHz or more is allocated to CG-102R1/302R1 and 50kHz or more is allocated to CG-102R2/302R2.

When load capacity is large

Potential unstable and abnormal oscillation may be concerned if 100pF or more of load capacity is observed. With a coaxial cable or shielding wire put under load, overload capacity is detected in some oscillators a load capacity if the cable or

wire reaches a length in excess of 50cm. In the event of the above, a 50Ω-resistor or buffer amplifier needs to be inserted between the relevant oscillator and load.

Characteristics

Distortion – Frequency

Output voltage deviation - Oscillation frequency

Expansion of the lower frequency range

$$\text{Type 1 } R_F = \frac{159}{(C_F + 0.01) \times f_o} \text{ [k}\Omega\text{]}$$

$$\text{Type 2 } R_F = \frac{159}{(C_F + 0.001) \times f_o} \text{ [k}\Omega\text{]}$$

C_F : [μF], f_o : [Hz]

Note: $1\text{Hz} \leq f_o \leq 1\text{kHz}$

$800\Omega \leq R_F \leq 800\text{k}\Omega$

Sync oscillation

CG-102/302 series oscillators are capable of bringing external synchronization signals into sync with oscillation output produced by the oscillators. The synchronization bandwidth is approx. 1.5%/Vrms.

The frequency of external synchronization signals is to be determined with great accuracy in advance, and then the oscillation frequency is allocated to agree with the frequency of external synchronization signal. Synchronization between the output frequency and external signal frequency is developed if an external signal (1V to 5Vrms) is added to Pin 1.

The graph at the right represents the phase difference between the external signal and oscillation output, besides the external signal level and synchronization band.

Note that potential change in oscillator level and increase in distortion may be concerned depending on the conditions of synchronization.

Ratio between sync input signal frequency and oscillation frequency without sync input

Oscillator Adapter

OP-102

OP-102 adapter can be used as a sine-wave oscillator that is capable of setting the frequency by a 3-digit BCD input, in combination with DT-212D series filters. Performance linked with oscillation frequency (setting method, setting accuracy, temperature coefficient) that DT-212D series filters offer is applied. Performance related to output voltage (accuracy, stability, temperature coefficient), however, is determined by OP-102 adapter. The output voltage has been trimmed to $2.5V_{rms} \pm 0.5\%$ internally but can be set between $0.5V_{rms}$ and $20V_{p-p}$ with the use of an external resistor. The oscillation frequency range is 1Hz to 100kHz. An external capacitor is required if 100Hz or less of frequency is obtained. OP-102 adapter is powered by $\pm 15V$ and a 20-pin single-inline package in dimensions of $51.5 \times 14.0 \times 4.0mm$.

▼Absolute maximum ratings

Supply voltage ($\pm V_s$)	$\pm 18V$
Signal input (Pins 13 and 15)	$\pm V_s$

▼Output characteristics

Output voltage	2.5Vrms	20Vp-p
Accuracy	Max. $\pm 0.5\%$	$\pm 0.6\%$ (typ)
Output voltage range	500mVrms to 2.5Vrms $\leq 100kHz$ 500mVrms to 20Vp-p $\leq 50kHz$ Short in a specified pin (20Vp-p) Set with an external resistor.	
Output resistance	Max. 5Ω (DT-212D)

Dimensions	$51.5 \times 14.0 \times 4.0mm$, Type S20

Note: The following specifications are applied unless otherwise specified:
 $23 \pm 5^\circ C$, $V_s = \pm 15V$, 1kHz, 2.5Vrms

Basic connection diagram

The following diagram represents the basic connection of oscillation at $2.5V_{rms}$ with this module connected to the DT-212DC2 filter.

The setting of oscillation frequency requires the utilization of digital signal input from the DT-212DC2 filter.
Input: TTL/CMOS compatible

Block diagram

Expansion of the lower oscillation frequency

Expansion of the lower oscillation frequency is enabled with the external capacitors C_{EXT} (2 pcs.) connected to the DT-212D filter as shown in Figure 3.

C_{EXT} is derived from the following equation.

C_{EXT}= 5×10⁴ / f_o [pF]

f_o: Oscillation frequency [Hz] when set at 001

The oscillation frequency range and C_{EXT} are listed below.

	Set resolution	C _{EXT} *1
100 to 100kHz	100Hz	500pF
10 to 15.99kHz	10Hz	5000pF
1** to 1.599kHz	1Hz	50000pF

- *1. Be sure to use an external loop filter to ensure 1Hz to 10Hz of oscillation if the adapter is used in the 1Hz to 1.599kHz range.
- *2. The DT-212DC1 filter is pre-assigned with 50000pF, and the DT-212DC2 filter is pre-assigned with 500pF.

Connected with C_{EXT}

Distortion improvement with external Cc

Distortion is improved by establishing the connection between the external capacitor C_c and OP-102 adapter as shown in Figure 4. No effects are considered if the external capacitors C_{EXT} are switched to use.

Connected with C_c

Distortion – Frequency characteristics

Distortion improvement with external loop filter

Deterioration in distortion is observed upon expansion of the lower oscillation frequency, but the connection with an external component contributes to improvement in distortion. The oscillation frequency range and circuit example are provided below.

1. 10Hz to 15.99kHz

Connected with loop filter

Distortion – Frequency characteristics

2. 1Hz to 1.599kHz

Connected with loop filter

Distortion – Frequency characteristics

Expansion of the lower oscillation frequency

The upper limit of oscillation frequency for 2.5Vrms of output is 100kHz, and for 20Vp-p is 50kHz. Oscillation up to 159.9kHz for 2.5Vrms and 100kHz for 20Vp-p is enabled through the connection with the protective circuit embedded in the OP-102 adapter.

The protective circuit goes into action when the connection between Pin ⑪ (DT-212D) and Pin ⑪ (OP-102) is established. The above, however, results in deterioration in distortion regardless of the range.

Distortion – Frequency characteristics

Output voltage setting

The setting of output voltage for the OP-102 adapter requires Pins ⑰ to ⑳. The following procedure should be used to vary output voltage.

1. 20Vp-p

The OP-102 adapter is outfitted with a trimmed resistor. Connect Pins ⑰ to ⑲.

2. 20Vp-p to 500mVrms

Connect an external resistor as shown below.

The output voltage is derived from the following equation:

$$R[k\Omega] = 1111/V_o \quad V_o: \text{Output voltage [Vrms]}$$

The standard values are provided above. Adjustment through the partial replacement of the resistor with a trimmer potentiometer is required to derive correct voltage.

Sync oscillation

Sync oscillation by external signals is to be ensured if R_{SYNC} is added as shown below.

The frequency range that allows synchronization varies with input voltages.

The most stable synchronization is maintained at 90° in the 0- to 180°- range of synchronization.

If a synchronization input voltage remains the same, the synchronization range can be changed by changing R_{SYNC} . Duplication of the input voltage is equivalent to a reduction of R_{SYNC} by half.

The following represents the standard input voltage of I/O phase difference to a frequency ratio, as parameter.

Synchronization input - Phase difference

f_{in} : Sync input signal frequency
 f_o : Oscillation frequency without sync input

■Amplitude and phase difference of 2-phase output

The OP-102 adapter is rated to deliver 2 types of output as follows: main output (Pin ⑮) and -90° (Pin ⑬). These outputs are equal in oscillation frequency but have slight errors in the output voltage and phase difference.

Examples of errors in amplitude and phase difference at main output and -90° output are provided below.

■Response for oscillation frequency setting

The output response to changes in the oscillation frequency setting is phase-continuous, which causes 300ns typ-delay.

VER : 500mV/div
HOR : 10ms/div

Random Binary Generator

CG-742N

CG-742N generator is a noise generator that produces false random binary signals with high stability.

The original oscillation frequency setting is completed with the external resistor or external clock, and a frequency demultiplier is embedded in the generator to facilitate the noise bandwidth setting.

The generator is allocated with long periodic noise source through pseudo random M series with the use of a 42-stage shift resistor. The CG-742N generator assures the output falling into TTL level and $\pm 5V$ for analog process. The initialization of pulse trains to be output is enabled with the use of the reset terminal, which can be applicable to reproducibility.

The filtering of outputs delivered by this generator contributes to the acquisition of power spectrum characteristics up to 100kHz.

Noise source	Pseudo random M series with a 42-stage shift resistor Cycle = $\frac{\text{Approx. } 4.398 \times 10^{12}}{f_o} [S]$ f_o : Clock frequency [Hz] 10.18 day at 5MHz of clock frequency Spectrum intervals 1.136 μHz at 5MHz of clock frequency
Original oscillation frequency	Allocated with the external resistor or TTL-level external clock.
Original oscillation frequency range	0.5M to 5MHz (with external resistor) Max. 5MHz (with external clock)
Frequency demultiplier (bypass enabled)	1/1, 1/10, 1/100, 1/1000 Set with the logic signals (TTL level). Latch function assigned
Output	Random binary output TTL level LSTTL (1 pc.) actuated $\pm 5V$ (no load) Output impedance: Approx. 100 Ω Load resistance: Min. 5k Ω (Max. 1mA) Rise/fall time: Max. 200ns
Power supply	$\pm 15V$ (± 11 to $\pm 16V$)
Maximum input voltage	(2)(12)(17)(21)(22)(23) +5.5V, -0.5
Dimensions	54.4x33.7x9.4mm, Type HA
Temperature/humidity range	Operation -20°C to +70°C, 10 to 95%RH Storage -30°C to +80°C, 10 to 80%RH

Note: The following specifications are applied unless otherwise specified:
23 $\pm 5^\circ\text{C}$, $V_s = \pm 15V$

Block diagram

Basic connection diagram 2 (White noise)

Usage

1. Oscillator

Either the built-in oscillator or external clock is available for M series drive.

a. When a built-in oscillator is used

$$f_{gen} = \frac{1}{R_F \times 2 \times 10^{-10}}$$

f_{gen} : Oscillation frequency [Hz]
 R_F : Element resistance [Ω]

b. When an external clock is used

T : Min. 200ns
T_{WH} : Min. 20ns
T_{WL} : Min. 20ns
Duty Any (enabled if 1:1 is not ensured)

c. Reset

Initialization of M series

The initialization of M series takes effect through the addition of pulses to Pin ② with an open collector or setting at 0V by contact signals, as show below. Proper initialization upon supply of the power is assured only if a rise in the supply voltage is at or less 10ms.

2. Frequency demultiplier

Clock derived from the built-in oscillator or external clock is to be divided with the frequency demultiplier into 1/10, 1/100, and 1/1000. The frequency demultiplier is under control of Pins ②① and ②② and, the setting is latched by Pin ②③ signal. Direct clock input to Pin ①⑦ is required if no built-in frequency demultiplier is necessary. Pin ①⑫ for frequency demultiplier input is connected to GND.

3. M series

Pin ①⑦ is designed for clock input.

T : 200ns (Max. 5MHz)
T_w : Min. 20ns

"H" : +5V
"L" : 0V

4. White noise

Outputs delivered by the CF-742N generator is random binary outputs ($\pm 5V$ -square waves with random cycles), which prompts the CF-742N generator to adopt the amplitude distribution (application of normal analog noise) as Gaussian distribution (normal distribution). Filtering is required to obtain flat frequency characteristics (white noise).

There is a close connection among the following: clock frequency (frequency of Pin ①⑦), low-pass filter cut-off frequency, equivalent noise bandwidth determined by filter order, peak factor of analog noise (filter output) and output voltage.

The filter cut-off frequency and clock frequency are derived from the equations shown at right.

a. Set the output voltage E_o [rms]. (Peak factor: Min. 4)

E_o ≤ 1.25V

E_o : RMS value of output voltage [Vrms]

b. Designate an equivalent noise bandwidth (B) and filter order to obtain filter cut-off frequency (f_c).

$$f_c = \frac{B}{k}$$

Table 1: Coefficient of noise bandwidth (Butterworth)

Order	k
1	1.57
2	1.11
3	1.05
4	1.03

f_c: Filter cut-off frequency [Hz]

B: Equivalent noise bandwidth [Hz]

K: Noise bandwidth coefficient (see table 1)

c. Derive a clock frequency (f_o) from the cut-off frequency (f_c) and output voltage (E_o).

$$f_o = \frac{50B}{E_o^2} \quad f_o: \text{Clock frequency [Hz]}$$

Characteristics

Random binary output probability density

Gaussian distribution output power spectrum

Gaussian distribution output autocorrelation

Condition: Clock frequency: 10kHz
Low-pass filter equivalent noise bandwidth: 200Hz
(2-pole Butterworth: $f_c = 180\text{Hz}$)

Technical data

Noise output characteristics after filtering

Power spectrum of random binary output is derived from the following equation:

$$P_E(f) = \frac{25}{f_0} [V^2/\text{Hz}] \quad (1)$$

f_0 : Clock frequency of random binary generator

Power spectrum varies along with filtering as shown below.

$$P_{EO}(f) = \frac{25}{f_0} |H(j\omega)|^2 \quad (2)$$

$H(j\omega)$: Filter transfer function

RMS value is determined from the following equation:

$$E_o = \sqrt{\frac{2.25}{f_0} \int_0^\infty |H(j\omega)|^2 d\omega} [\text{rms}] \quad (3)$$

If it is simplified,

$$E_o = \sqrt{\frac{50}{f_0}} A^2 B [\text{rms}] \quad (4)$$

B: Equivalent noise bandwidth

A: Filter pass-band gain

The equivalent noise bandwidth (B) is defined as follows:

$$B = \frac{1}{A^2} \int_0^\infty |H(j\omega)|^2 d\omega \quad (5)$$

The filter order-equivalent noise bandwidth (B) relationship is provided in Table 1.

Flatness of not only noise bandwidth but noise frequency is of importance to use frequency as white noise.

Random binary amplitude characteristics are expressed by the following equation:

$$E(f) = \frac{\sin(\pi f/f_0)}{\pi f/f_0} \quad (6)$$

Amplitude characteristics are obtained as shown in Table 2.

Table 1

Order	B
1	1.57 f_c
2	1.11 f_c
3	1.05 f_c
4	1.03 f_c

Butterworth characteristics applied

Table 2 Random binary output amplitude characteristics

Figure 1 Random binary output amplitude characteristics

Amplitude characteristics of Butterworth low-pass filters are assigned with "1" for a pass-band gain.

$$E_o(f) = \sqrt{\frac{1}{1+(f/f_c)^{2n}}} \quad (7)$$

Amplitude characteristics are obtained as shown in Table 3.

Table 3: Butterworth filter amplitude characteristics

f/f_c	Amplitude [dB]			
	1-pole	2-pole	3-pole	4-pole
0.001	-0.00	0.00	0.00	0.00
0.01	-0.00	-0.00	0.00	0.00
0.1	-0.04	-0.00	-0.00	-0.00
0.2	-0.17	-0.01	-0.00	-0.00
0.3	-0.37	-0.04	-0.00	-0.00
0.4	-0.64	-0.10	-0.02	-0.00
0.5	-0.97	-0.26	-0.07	-0.02
0.6	-1.34	-0.53	-0.20	-0.07
0.7	-1.73	-0.93	-0.48	-0.24
0.8	-2.14	-1.49	-1.01	-0.67
0.9	-2.57	-2.19	-1.85	-1.55

The peak factor (P.F.) is defined as follows:

$$\text{P.F.} = \frac{E_p}{E_o} \quad (8)$$

Assign 5 [Vo-p] to peak value (E_p) for the generator, and substitute E_o from Equation (4).

$$\text{P.F.} = \frac{5}{\sqrt{\frac{50}{f_0}} A^2 B} \quad (9)$$

To use it as Gaussian random noise, determine E_o to maintain 4 in peak factor.

Phase Detector

CD-552R3 CD-552R4

CD-552R series detectors are an on-board phase detectors possessing frequencies falling within the range of 1kHz to 200kHz for CD-552R3 and frequencies falling within the range of 10kHz to 2MHz for CD-552R4.

The signal system is composed of the phase sensitive detector (PSD), low-pass filter (LPF), and output amplifier. A low-pass expansion of output low-pass filter cut-off frequency is available with the addition of one external resistor, and the gain setting ($\times 1$ to $\times 10$) is also enabled. The reference signal system consists of a 0° - 90° phase shifter (PAT.P) and 50%-duty circuit (PAT.P), which enables the detection of $A \sin \phi$ or $A \cos \phi$ phase. The phase detection with double frequency is permitted if 2f mode is placed through the connection with the specified pin.

CD-552R series detectors are in a static-shielded 20-pin single inline package.

Pattern design

Proper connection between the case ground and the GND potential should always be assured. No sufficient shielding effect is produced if disregarded.

No signal traces should be assigned on the maximum visible outline of the component mounting surface. Possible contact between the metal case and the board is observed around the maximum visible outline, which triggers the establishment of a short circuit between the signal and case. A ground plane pattern is recommended to incorporate into the maximum visible outline and the inside of the case to enhance shielding effect.

To assure dynamic range and stability

■ Signal pre-processing

If a sufficient S/N ratio fails to be obtained by the optimization of detector input level or setting of the output amplifier, a filter needs to be inserted in front of the detector to enhance the S/N ratio of input signal.

The filter falls into the four types (low-pass, high-pass, band pass, and band elimination) and becomes a determinant of the following items: asynchronous signal frequency component, amplitude characteristics, filter characteristics, and cut-off frequency.

The band pass filter attenuates all signals other than synchronization signal, which maximizes the improvement of the S/N ratio. Relatively large variations in phase around the center frequency, which may lead to detection accuracy if a phase change is made in response to temperature drift. Phase drift is minimized if low-order (1-pole if possible) Q is assigned.

The low-/high-pass filters attenuate low-/high-pass signals, and offer the smaller improvement of the S/N ratio as compared with the band pass filter. A phase change at a pass band is curbed, which contributes to a smaller detection accuracy attributed to fluctuations in cut-off frequency.

The band elimination provides large attenuation to signals of specified frequencies. An efficient improvement of the S/N ratio is obtained if specified frequency is assigned to the asynchronous signal. The least phase change at a pass band is assured, which minimizes a detection accuracy attributed to fluctuations in cut-off frequency.

■ Input signal level

CD-552R3/4 detectors features 10V_{0-p} of the maximum input level. A dynamic range can be assured if a large level of synchronization signal is input by maintaining within 10V_{0-p}. The actual input signal contains both asynchronous and synchronization signals, which requires a decrease in the amplitude of 10V_{0-p} or less.

E.g.: 0.1V_{0-p} synchronization signal is present in 1V_{0-p} signal that is a total of asynchronous and synchronization signals. CD-552R3/4 detectors performs the detection of the signals at 1V_{dc} of output despite the ×10-post-stage DC amplifier being designated. The allowable input level enables a ×10-amplifier to be inserted in front of the CD-552R3/4 detectors to input the maximum input voltage of 10V_{0-p}. The detection output obtains 10V_{dc} when the ×10-post-stage DC amplifier is designated, which allows the obtainment of the maximum output signal.

■ Output amplifier

The output amplifier is capitalized on to obtain a proper output level if a small detection output remains despite the optimization of input signals. CD-552R3/4 detectors are outfitted with the variable-gain output amplifiers (×1 to ×10). The maximum output voltage is set at 10V_{0-p} that should not be surpassed when setting gain to assure proper voltage for post processor.

Note that an increase in DC drift, offset voltage and output noise is considered with an increase in gain.

Phase adjustment

Phase detection with the use of the CD-552R3/4 detectors may require phase adjustment for the optimization of detection sensibility and cancellation of processing phase.

Phase adjustment is conducted in combination with the voltage controlled phase detector CD-951V4. Continuous change in phase shift of the reference signal is enabled through DC voltage.

Evaluation board

A module-mounted evaluation board is available for easy evaluation of this module. Contact us for further information.

Phase Shifter

CD-951V4

CD-951V4 is a 360°-voltage controlled phase shifter in the frequency range of 1kHz to 2MHz, and adopts CMOS-level (0/+5V) square wave for input and output. This is composed of the $\pm 100^\circ$ -variable voltage controlled phase circuit and 50%-duty circuit (PAT.P) with 0/180° switch. The combination use of the $\pm 100^\circ$ -phase shifter and 0/180°-selector enables the output of 50%-duty square wave that phase is shifted in the 360° range to the phase shifter input signal.

Double frequency is produced by the 50%-duty input signal if 2f mode is placed through the connection with the specified pin.

CD-951V4 is in a static-shielded 20-pin single-inline package, which is a great contributor to the implementation of high precision signal processing and high density mounting.

▼Absolute maximum ratings

Supply voltage ($\pm V_s$)	$\pm 18V$
Phase control	$\pm V_s$
DC input voltage	
Phase shifter input voltage	+5.5V, -0.5V
Logic control voltage	+5.5V, -0.5V

▼50%-duty output/voltage control phase shifter

▽Setting

Setting	Pins 15-16 shorted, Pin 17 open
I/O characteristics	50%-duty square wave, which a phase is shifted by voltage control, is output with reference to the edge specified at polarity switch of phase shifter input signal waveform.

▼Frequency range

Frequency range	1kHz to 2MHz (2 ranges available: 1kHz to 200kHz, 10kHz to 2MHz)
Range switch	Pin 12 open or +5V: 1kHz to 200kHz 0V: 10k to 2MHz

▼Phase shifter input characteristics

Input circuit	CMOS Schmitt trigger, pulled up at 100 k Ω
Trip point	+3.5V/+1.5V (typ)
Input voltage	CMOS (0/+5V) level
Unipolar (1f) mode	A rising or falling edge is regarded as a reference.
Polarity switch	Pin 13 open or +5V: Rising edge regarded as a reference 0V: Falling edge regarded as a reference
Pulse duration	Min. 50nsc
Bipolar(2f) mode	Both rising and falling edge are regarded as a reference.
Mode setting	Connected with the phase shifter input (Pin 14) and polarity switch input (Pin 13).
Input waveform	Duty : 50%
Input frequency range	1kHz to 1MHz

▼Voltage control characteristics

Control method	Phase shift is specified in the proportion to phase control DC input voltage.
Input resistance	100k Ω $\pm$ 3% (DC)
Linear maximum input voltage	$\pm 5V$ $\leq$ 1MHz
Linear control range	$\pm 90^\circ$
Voltage control sensitivity	-20°/V (-100°/+5V, 100°/-5V)
Sensitivity accuracy	$\pm 1^\circ/V$

▽Phase shifter output characteristics

Output circuit	HCMOS output, series resistor at 100 Ω
Output voltage	CMOS (0/+5V) level
Duty	50% $\pm$ 0.03% (typ) (at 200kHz) 50% $\pm$ 0.3% (typ) (at 2MHz)
0/180° switch	Pin 20 open or +5V : -180°, 0V : 0°
-180° accuracy	-180° $\pm$ 0.02° (typ) (at 200kHz) -180° $\pm$ 0.2° (typ) (at 2MHz)
Phase offset	(1k to 200kHz) -0.6° (typ) (at 1kHz) -4.5° (typ) (at 200kHz) (10kHz to 2MHz) -0.9° (typ) (at 10kHz) -42.0° (typ) (at 2MHz)
Phase offset adjustment	Adjustment available with a 20k Ω -external potentiometer. (Pin 2)
Adjustment range	$\pm 5^\circ$ (typ)

▼Reference voltage

Output voltage/accuracy	Max. $\pm 5V \pm 2\%$
Temperature stability	50ppm/°C (typ)
Maximum output current	$\pm 1mA$

▼Others

Recommended supply voltage	$\pm 15V \pm 1V$
Quiescent current	+25mA (max), +18mA (typ) -20mA (max), -12mA (typ)
Temperature/humidity range	Operation -20°C to 70°C, 10 to 90%RH Storage -30°C to 80°C, 10 to 80%RH
Dimensions	67 $\times$ 10.5 $\times$ 20mm (protrusion not included) Type SS20 (20-pin shielded SIP)
Weight (NET)	Approx. 20g

Note: The following specifications are applied unless otherwise specified:
23 $\pm$ 5°C, Supply voltage: $\pm 15V$

Basic connection diagram

Block diagram

PHASE OFFSET

This is used to cancel phase offset. Zero adjustment of the phase offset for CD-951V4 phase shifter only is enabled in the range of 1kHz to 200kHz. Both terminals of a trimmer potentiometer of 20kΩ min. are connected with ±5V input (Pins ⑥ and ⑦), and the center terminal is connected to the PHASE OFFSET terminal.

200k/2M

This is used to switch the operating frequency range between 1kHz-200kHz and 10kHz-2MHz in response to the used frequency.

HI: 1kHz to 200kHz (The pin is open)

LO: 10kHz to 200MHz

NOR/INV

This is used to switch the output phase between 0° and 180°. A 360°-phase shifter is configured in combination with a continuously variable phase shifter (±90°).

HI: 0° (The pin is open)

LO: 180°

DUTY50 IN POL

This is used to switch the input polarity of the 50%-duty circuit. "HI" (open) should remain on for normal connection.

HI: Rising edge regarded as a reference
(The pin is open)

LO: Falling edge regarded as a reference

SHIFTER IN POL

This is used to switch the reference polarity of shifter input. The operation at double frequency, as compared with the reference signal, is actualized through the connection between the SHIFTER IN POL terminal and SHIFTER IN terminal if 50% of duty is assigned to the reference signal.

HI: Rising edge regarded as a reference
(specified when the pin is open)

LO: Falling edge regarded as a reference

Connected with SHIFTER IN terminal:

Both rising and falling edge regarded as a reference

Timing chart

This timing chart presents the operation of the voltage controlled phase shifter CD-951V4.

E.g.: The CD-951V4 phase shifter is set to regard a rising edge of the input signal as a phase reference. This detector produces the signal "LO" (Pin ⑮) for the time proportionate to the control voltage (t_d) if a rise is observed in the input signal (Pin ⑭).

Waveform shaping (Pin ⑱) is performed to assure 50% in duty ($t_1 = t_2$) with reference the rising edge in the obtained signal.

t_d adjustment allows continuous change in input/output rise time (t_{sft}), which denotes phase change.

The same operating principles* are applied to the phase detector CD-552R3 that has realized 90°-phase shift with high accuracy.

* Patent pending

Usage example 2-phase detector

This example indicates the adoption of this detector to the 2-phase detector. The cos and sin detection outputs are obtained, which allows amplitude and phase of the synchronization signals to be derived from the relevant vector operation.

The settings of GAIN ($\times 1$ to $\times 10$) and LPFfc (max. 1kHz) are available in this detector. Offset adjustment is required as necessary. Phase adjustment is available by 90°-continuous phase shift (CD-951V4 R1) or 0/180°-switch (S33), which enables 360°-phase change in total.

GAIN setting: Short: $\times 10$

Open: $\times 1$

LPFfc setting (same as R21):

Short: 1kHz

Note: See the CD-552R3/R4 in Page 72 for details in the GAIN setting and LPF setting.

Characteristics

Control voltage coefficient - Temperature

Phase Detector

CD-505R2

CD-505R2 detector is a hybrid phase detector composed of the following units: input differential amplifier, two post amplifiers, band-pass filter, phase shifter, phase detector, and low-pass filter. This detector possessing the frequency range of 10Hz to 10kHz enables the setting of center frequency with the use of the resistors (2 pcs.). Not only gain setting for the post amplifiers with the resistors (2 pcs.) but phase setting with the resistor and trimmer potentiometer is also available.

The reference signal is designed to apply square wave with 1:1 of a duty factor, and the phase shifter assures its phase adjustment in the range of $\pm 45^\circ$. The post amplifier can be utilized as a 90° -phase shifter and inverting amplifier that actualizes $\pm 360^\circ$ -adjustment with the combined use of the switch.

The 2-pole low-pass filter ($Q = 0.5$) is allocated, which facilitates the setting of the equivalent noise bandwidth with the use of resistors and capacitors.

▼Absolute maximum ratings

Supply voltage ($\pm V_s$)	$\pm 18V$
Signal input voltage	$\pm V_s$ ①, ③, ⑤, ⑪, ③③, ③⑨
Reference signal input voltage	+5.5V ②①

▼Input amplifier

Input form	Differential input
Input impedance	Differential input 200k Ω Inverting input 100k Ω Non-inverting input 200k Ω
Gain	$\times 1$
Frequency characteristics	DC to 10kHz
Maximum input voltage (linear)	$\pm 10V$

▼Post amplifier

Gain	$\times 1$ to $\times 100$ (2-stage amplifier, $\times 10 \times 2$) Setting : Specified with external resistors (2 pcs.).
I/O phase	In-phase
Frequency characteristics	DC to 10kHz

▼Band pass filter

Characteristics	1-pole pair band pass filter
Q	5
Center frequency (fo)	Range: 10Hz to 10kHz
Setting method	Setting: Specified with external resistors (2 pcs.). $R_{BP} \leq 1.59M\Omega$ Combined use of external capacitor is also available if 100Hz or less is obtained.
Gain	0dB ± 0.5 dB

▼Phase shifter

Frequency range	10Hz to 10kHz
Phase shift	Range: $90^\circ \pm 45^\circ$ Setting: Specified with an external resistor and a trimmer potentiometer Combined use of an external capacitor is also available if 100Hz or less is obtained.
Gain	$\times 1$

▼Phase detector

Frequency range	10Hz to 10kHz
Type	Synchronous detection (with reference signal)
Reference signal	TTL level, Duty factor: 1:1
Input processing (internal)	Pulled down at 100k Ω
Offset	$\phi 1/\phi 2$ balanced, Output offset adjustment available with an external trimmer potentiometer.

▼Low-pass filter

Characteristics	2-pole low-pass filter
Equivalent noise bandwidth	Range: 30Hz to 1kHz (with 2 external resistors) Any setting is available with 2 external resistors (R_{LP}) and 2 capacitors (C_{LP}).

▼Others

Supply voltage	$\pm 15V$ (± 14 to $\pm 16V$)
Quiescent current	$\pm 30mA$ (typ)
Temperature/humidity range	Operation $-20^\circ C$ to $70^\circ C$, 10 to 95%RH Storage $-30^\circ C$ to $80^\circ C$, 10 to 80%RH
Dimensions	54.4 $\times$ 33.7 $\times$ 6.5mm Type H

Note: The following specifications are applied unless otherwise specified:
23 $\pm 5^\circ C$, $\pm 15V$

Basic connection diagram

●Usage example of post amplifier

- 1. Signal system amplifier for the detection of micro-input signals
- 2. Instrumentation amplifier to obtain a large CMRR at high input impedance
- 3. Phase shifter to assure the 360° -range for phase adjustment

●Calculation of constant

- 1. To determine the center frequency
 - ➡Band pass filter: $R_{BP} 1, 2$ ($C_{BP1,2}$)
- 2. To determine the phase shift
 - ➡Phase shifter: C_ϕ , R_ϕ , RV_ϕ
- 3. To determine the equivalent noise bandwidth
 - ➡Low-pass filter: $R_{LP} 1, 2$ ($C_{LP1,2}$)

Block diagram

①-④: Input amplifier

The input amplifier is a differential amplifier carrying Pin ① for non-inverting input and Pin ② for inverting input. The basic usage of the input amplifier is shown below.

1. Differential amplifier

2. Inverting amplifier

3. Non-inverting amplifier

⑪-⑭: Phase shifter

The phase shifter is used to adjust signal system phase in the 90°-range. Phase adjustment exceeding the above range requires the 360°-phase shifter application. Signal monitor terminal: Pins ⑲ and ⑳

⑤-⑩: Band pass filter

This band pass filter enables the measurement of fundamental waves with harmonics eliminated. By using external components, it is possible to configure a 1-pole pair band pass filter ($Q=5$). This band pass filter is capable of providing an attenuation of 20dB to 3-order harmonics and of 26dB to 5-order harmonics. With R_{BP} used, center frequency adjustment for the band pass filter is performed to keep a phase difference "0" or "180°" through a comparison between the input signal and BPF OUT terminal ⑧ signal.

PSD

This is used for the phase detection in 2-phase signals by the reference signal.

⑯-⑳: LPF

This is a low-pass filter capable of determining the equivalent noise bandwidth. The configuration of a 2-pole LPF is enabled with the use of the external resistors (2 pcs.) or the combined use of the external capacitor according to frequency. Some use applications may require the use of a 1-pole pair low-pass filter. See Page 83 for details.

Offset adjustment

Offset adjustment is required for 2 places.
Use the following procedures for offset adjustment.

1. BALANCE (RV1)

Establish a ground for +/- inputs. The PSD OUT terminal ⑩ is to be monitored at the maximum sensitivity of the oscilloscope. Input the reference signal at the used frequency, and adjust the BALANCE RV1 to minimize p-p of the square wave.

2. OFFSET (RV2)

Use the same steps to connect the DC OUT ⑳ to the DC voltmeter. Adjust the OFFSET volume to obtain "0" in output DC voltage.

Note: Offset voltage contains frequency characteristics, which requires re-adjustment if a change is made in the signal frequency.

Band pass filter setting

Table 1: RBP constants

fo	No CBP used		CBP used	
	RBP	CBP	RBP	CBP
10kHz	1.58kΩ	—	—	—
1kHz	15.8kΩ	—	—	—
100Hz	158kΩ	—	14.3k	0.1μ
10Hz	1.58MΩ	—	143k	0.1μ

fo fine adjustment

Fine adjustment of center frequency requires a trimmer potentiometer to be assigned to either of RBPs as series.

If a frequency is out of the constants listed in Table 1, RBP and CBP need to be derived from the following equations.

$$f_o \geq 100\text{Hz}$$

$$R_{BP} = \frac{15915}{f_o} [\text{k}\Omega] \quad f_o: [\text{Hz}]$$

$$f_o < 100\text{Hz}$$

$$P_{BP} = \frac{1.5915 \times 10^5}{(0.01 + C_{BP}) \cdot f_o} [\Omega] \quad f_o: [\text{Hz}], C_{BP}: [\mu\text{F}]$$

$$1.59\text{k}\Omega \leq R_{BP} \leq 1.59\text{M}\Omega$$

Phase shifter setting

1) When any frequency is allocated: 1

$1\text{k}\Omega \leq R_\phi \leq 100\text{k}\Omega$
Determine R_ϕ and C_ϕ from the following equation to agree with the above values.

$$R_\phi = \frac{1}{2\pi \cdot (C_\phi + 3.9 \times 10^{-9}) \cdot 2.72f} [\Omega]$$

$f: [\text{Hz}]$
 $C_\phi: [\text{F}]$

Derive RV_ϕ in accordance with the conditions of the determined R_ϕ and $RV_\phi \geq 6.67 R_\phi$.

E.g.: 400Hz

$$C_\phi = 1700\text{pF}$$

216.1kΩ is derived for R_ϕ from the above equation.

$$RV_\phi > 174\text{k}\Omega \text{ leads to } RV_\phi = 200\text{k}\Omega.$$

2) When any frequency is allocated: 2

$$RV_\phi = 100\text{k}\Omega$$

$$C_\phi = \frac{1}{2\pi \cdot f \cdot 40.8 \times 10^5} [\text{F}]$$

$$f: [\text{Hz}]$$

Determine C_ϕ from the following equation.

3) When 1kHz is allocated

If 1kHz is allocated to the used frequency, $\pm 45^\circ$ -phase shift is enabled with an external potentiometer only.

	Connection diagram 1			Connection diagram 2		Connection diagram 3
	C_ϕ	RV_ϕ	R_ϕ	C_ϕ	RV_ϕ	RV_ϕ
10kHz	—	10k	1.5k	390p	100k	—
1kHz	—	—	—	—	—	100k
100Hz	—	1M	150k	39000p	100k	—
10Hz	39000pF	1M	150k	0.39μ	100k	—

■Equivalent noise bandwidth setting

1) When 2-pole low-pass filter is used

Equivalent noise bandwidth	Time constant (TC)	Connection diagram	R _{LP1, 2}	C _{LP1, 2}
100Hz	1.25msec	1	124kΩ	—
30Hz	4.17msec	1	412kΩ	—
10Hz	12.5msec	1	1.24MΩ	—
3Hz	41.7msec	2	41.2kΩ	1μF
1Hz	125msec	2	124kΩ	1μF
0.3Hz	417msec	2	412kΩ	1μF
0.1Hz	1.25sec	2	1.24MΩ	1μF
0.03Hz	4.17sec	2	412kΩ	10μF
0.01Hz	12.5sec	2	1.24MΩ	10μF

Time constant (TC)=R_{LP} • C_{LP}
 Equivalent noise bandwidth=1/8TC { Any R_{LP} and C_{LP} available
 according to 10kΩ≤R_{LP}≤1.59MΩ.

A settling time for output voltage is 6- to 7-times time constant.

<Figure 1> Equivalent noise bandwidth: 10Hz to 100Hz

<Figure 2> Equivalent noise bandwidth <10Hz

2) When 1-pole low-pass filter is used

Equivalent noise bandwidth	Time constant (TC)	Connection diagram	R _{LP1, 2}	C _{LP1, 2}
100Hz	2.5msec	1	249kΩ	—
30Hz	8.33msec	1	825kΩ	—
10Hz	25msec	2	226kΩ	0.1μF
3Hz	83.3msec	2	750kΩ	0.1μF
1Hz	250msec	2	249kΩ	1μF
0.3Hz	833msec	2	825kΩ	1μF
0.1Hz	2.5sec	2	249kΩ	10μF
0.03Hz	8.33sec	2	825kΩ	10μF
0.01Hz	25.0sec	2	1.13MΩ	22μF

Time constant (TC)=R_{LP} • C_{LP}
 Equivalent noise bandwidth=1/4TC { Any R_{LP} and C_{LP} available
 according to 10kΩ≤R_{LP}≤1.59MΩ.

A settling time for output voltage is 4- to 5-times time constant.

<Figure 1> Equivalent noise bandwidth: 30Hz to 100Hz

<Figure 2> Equivalent noise bandwidth <30Hz

■Application of post amplifier

●Signal system amplifier

$$A_1 = \frac{R_{G1} + 10k}{R_{G1}} \quad A_2 = \frac{R_{G2} + 10k}{R_{G2}} \quad R_{G1}, R_{G2} : [k\Omega]$$

A₁, A₂ ≤ 10

E.g.: R_{G1} = R_{G2} = 1.11kΩ if 10 is assigned to A₁ and A₂

●360°-phase shifter

Determine Cφ2 [F].

$$R\phi_2 = \frac{1}{2\pi \cdot f \cdot C \phi_2} [\Omega]$$

$$f : [Hz]$$

* 1.59kΩ ≤ Rφ2 ≤ 1.59MΩ

●Instrumentation amplifier

Gain between input and Pin ④

$$\text{Gain} = \frac{R_{G3} + 20 \times 10^3}{R_{G3}} R_{G3} : [\Omega]$$
