

DUAL 1:5 LOW JITTER BUFFER/LEVEL TRANSLATOR (<1.25 GHz)

Features

- 10 differential or 20 LVCMOS outputs
- Ultra-low additive jitter: 100 fs rms
- Wide frequency range: 1 MHz to 1.25 GHz
- Any-format input with pin selectable output formats: LVPECL, Low Power LVPECL, LVDS, CML, HCSL, LVCMOS
- Asynchronous output enable
- Low output-output skew: <50 ps
- Low propagation delay variation: <400 ps
- Output clock division: /1, /2, /4
- Independent V_{DD} and V_{DDO} : 1.8/2.5/3.3 V
- Excellent power supply noise rejection (PSRR)
- Selectable LVCMOS drive strength to tailor jitter and EMI performance
- Small size: 44-QFN (7 mm x 7 mm)
- RoHS compliant, Pb-free
- Industrial temperature range: -40 to +85 °C

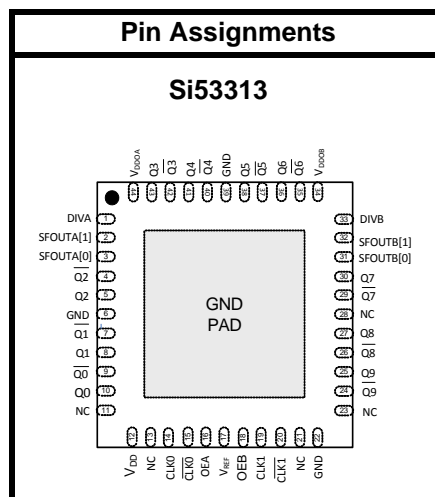

Applications

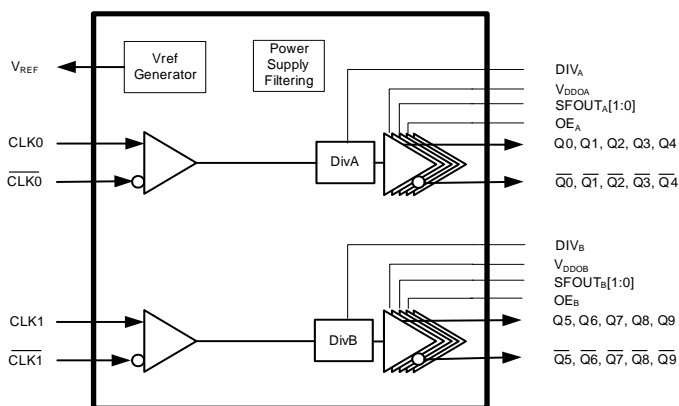

- High-speed clock distribution
- Ethernet switch/router
- Optical Transport Network (OTN)
- SONET/SDH
- PCI Express Gen 1/2/3
- Storage
- Telecom
- Industrial
- Servers
- Backplane clock distribution

Description

The Si53313 is an ultra low jitter ten output differential buffer with pin-selectable output clock signal format and divider selection. The Si53313 utilizes Silicon Laboratories' advanced CMOS technology to fanout clocks from 1 MHz to 1.25 GHz with guaranteed low additive jitter, low skew, and low propagation delay variability. The Si53313 features minimal cross-talk and provides superior supply noise rejection, simplifying low jitter clock distribution in noisy environments. Independent core and output bank supply pins provide integrated level translation without the need for external circuitry.

2. Functional Description

The Si53313 is a low jitter, low skew dual 1:5 differential output buffer. The device has a universal input that accepts most common differential or LVCMOS input signals. Each output bank features control pins to select signal format, output enable, output divider setting and LVCMOS drive strength.

2.1. Universal, Any-Format Input

The Si53313 has a universal input stage that enables simple interfacing to a wide variety of clock formats, including LVPECL, LVCMOS, LVDS, HCSL, and CML. Tables 12 and 13 summarize the various input ac- and dc-coupling options supported by the device. Figures 3 and 4 show the recommended input clock termination options.

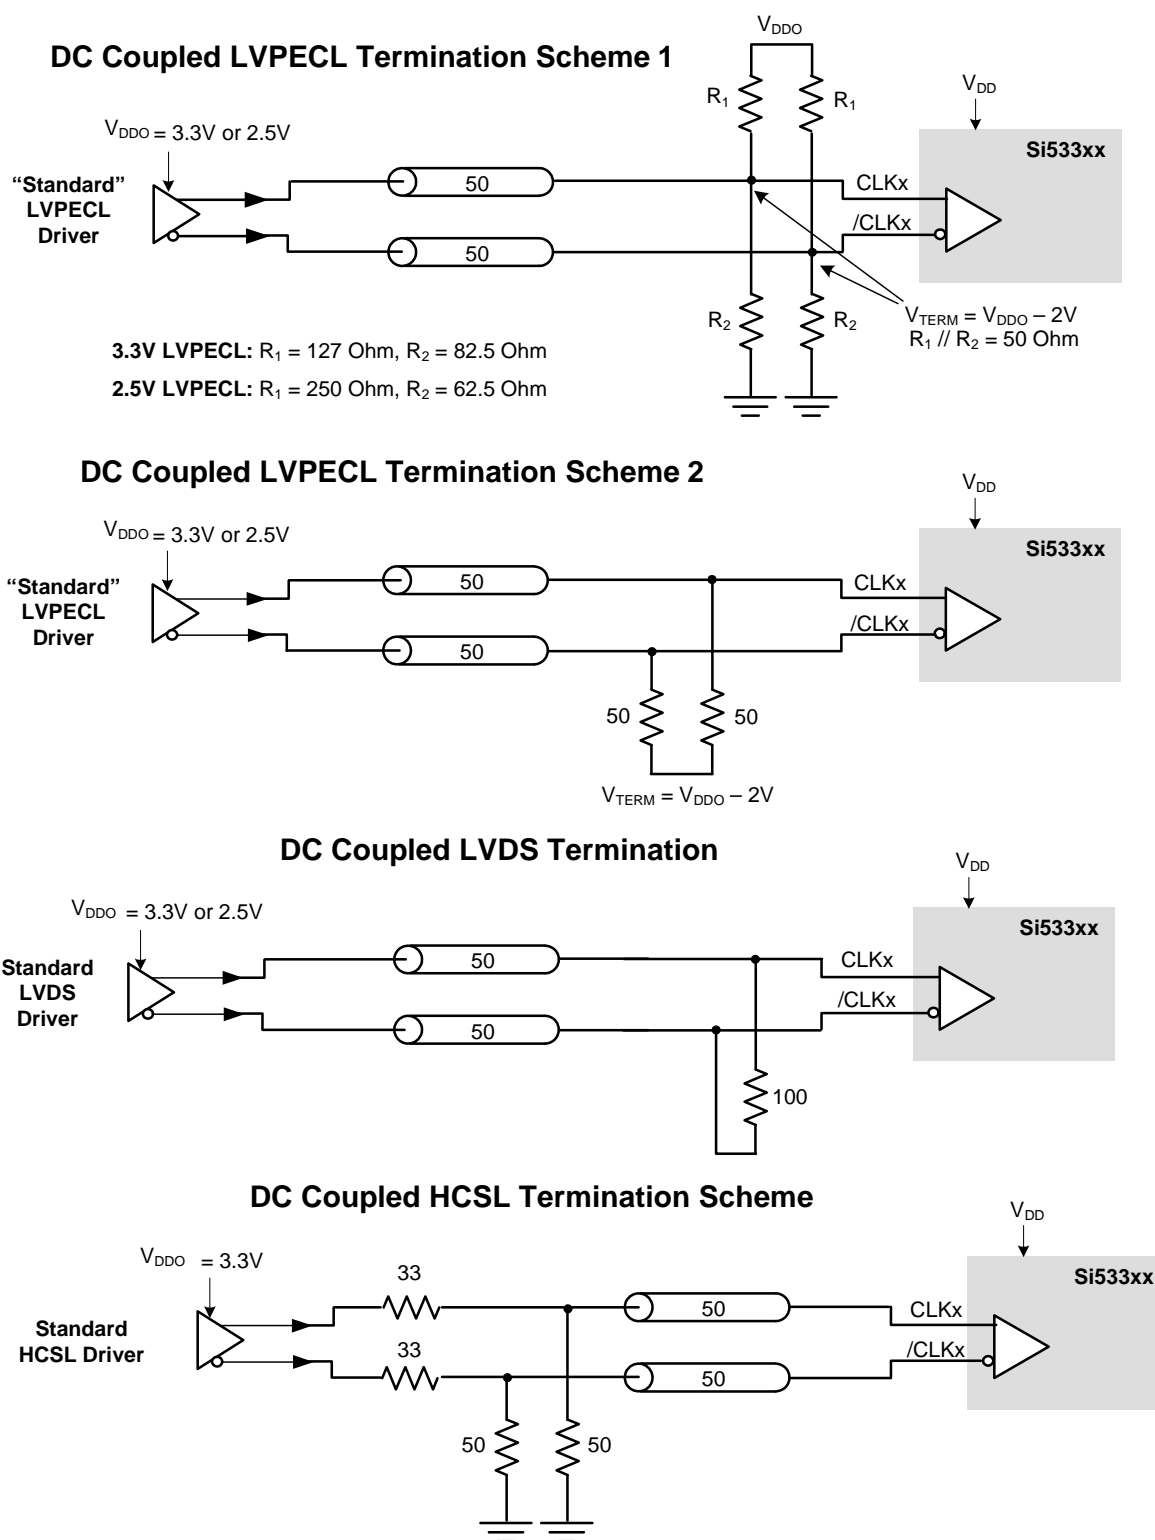

Figure 2. LVCMOS DC-Coupled Input Termination

Note: 33 Ohm series termination is optional depending on the location of the receiver.

Figure 3. Differential DC-Coupled Input Terminations

2.2. Input Bias Resistors

Internal bias resistors ensure a differential output low condition in the event that the clock inputs are not connected. The noninverting input is biased with a 18.75 kΩ pulldown to GND and a 75 kΩ pullup to V_{DD}. The inverting input is biased with a 75 kΩ pullup to V_{DD}.

Figure 4. Input Bias Resistors

2.3. Universal, Any-Format Output Buffer

The Si53313 has highly flexible output drivers that support a wide range of clock signal formats, including LVPECL, low power LVPECL, LVDS, CML, HCSL, and LVCMOS. SFOUTA[1] and SFOUTB[1] are 3-level inputs that can be pin-strapped to select the Bank A and Bank B clock signal formats, respectively. This feature enables the device to be used for level translation in addition to clock distribution, minimizing the number of unique buffer part numbers required in a typical application and simplifying design reuse. For EMI reduction applications, four LVCMOS drive strength options are available for each V_{DDO} setting.

***Note:** SFOUTX[1:0] are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin floats to V_{DD}/2.

2.4. Flexible Output Divider

The Si53303 provides optional clock division in addition to clock distribution. The divider setting for each bank of output clocks is selected via 3-level control pins as shown in the table below. Leaving the DIVX pins open will force a divider value of 1 which is the default mode of operation.

Table 15. Divider Selection

DIVX	Divider Value
Open*	÷1 (default)
0	÷2
1	÷4

***Note:** DIVX are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin floats to $V_{DD}/2$.

2.5. Output Enable Logic

Each 1:5 output has an independent clock input (CLK0/CLK1) and an output enable pin. The table below summarizes the input and output clock based upon the state of the input clock and the OE pin.

Table 16. Input Clock and Output Enable Logic

CLK	OE ¹	Q ²

Notes:

1. Output enable active high
2. On the next negative transition of CLK0 or CLK1.
3. Single-end: Q=low, \overline{Q} =high
Differential: Q=low, \overline{Q} =high

2.6. Power Supply (V_{DD} and V_{DDOX})

The device includes separate core (V_{DD}) and output driver supplies (V_{DDOX}). This feature allows the core to operate at a lower voltage than V_{DDO} , reducing current consumption in mixed supply applications. The core V_{DD} supports 3.3V, 2.5V, or 1.8V. Each output bank has its own V_{DDOX} supply, supporting 3.3V, 2.5V, or 1.8V.

2.7. Output Clock Termination Options

The recommended output clock termination options are shown below. Unused output clocks should be left floating.

2.11. Power Supply Noise Rejection

The device supports on-chip supply voltage regulation to reject noise present on the power supply, simplifying low jitter operation in real-world environments. This feature enables robust operation alongside FPGAs, ASICs and SoCs and may reduce board-level filtering requirements. For more information, see AN491: Power Supply Rejection for Low Jitter Clocks.

Notes:

General

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.

Solder Mask Design

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

Stencil Design

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2x2 array of 1.0 mm square openings on 1.45 mm pitch should be used for the center ground pad.

Card Assembly

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

7. Top Marking

7.1. Si53313 Top Marking

7.2. Top Marking Explanation

Mark Method:	Laser	
Font Size:	1.9 Point (26 mils) Right-Justified	
Line 1 Marking:	Device Part Number	53313-B-GM
Line 2 Marking:	YY=Year WW=Work Week	Assigned by Assembly Supplier. Corresponds to the year and work week of the mold date.
	TTTTTT=Mfg Code	Manufacturing Code from the Assembly Purchase Order form.
Line 3 Marking:	Circle=1.3 mm Diameter Center-Justified	"e3" Pb-Free Symbol
	Country of Origin ISO Code Abbreviation	TW
Line 4 Marking	Circle = 0.75 mm Diameter Filled	Pin 1 Identification
