

NB3F8L3010C

3.3V / 2.5V / 1.8V / 1.5V 1:10 LVCMOS Fanout Buffer

Description

The NB3F8L3010C is a 3:1:10 Clock / Data fanout buffer operating on a 3.3 V / 2.5 V Core V_{DD} and a flexible 3.3 V / 2.5 V / 1.8 V / 1.5 V V_{DDO} supply which must be equal or less than V_{DD} .

A Mux selects between a Crystal input, or either of two differential/SE Clock / Data inputs. Differential Inputs accept LVPECL, LVDS, HCSL, or SSTL and Single-Ended levels. The MUX control lines, SEL0 and SEL1, select CLK0/ $\overline{\text{CLK0}}$, CLK1/ $\overline{\text{CLK1}}$, or Crystal input pins per Table 3. The Crystal input is disabled when a Clock input is selected. Output enable pin, OE, synchronously forces a High Impedance state (HZ) when Low per Table 4.

Outputs consist of 10 single-ended LVCMOS outputs.

Features

- Ten CMOS / LVTTTL Outputs up to 200 MHz
- Differential Inputs Accept LVPECL, LVDS, HCSL, or SSTL
- Crystal Oscillator Interface
- Crystal Input Frequency Range: 10 MHz to 40 MHz
- Output Skew: 10 ps Typical
- Additive RMS Phase Jitter @ 125 MHz, (12 kHz – 20 MHz): 0.03 ps (Typical)
- Synchronous Output Enable
- Output Defined Level When Input is Floating
- Power Supply Modes:
 - ♦ Single 3.3 V
 - ♦ Single 2.5 V
 - ♦ Mixed 3.3 V $\pm$ 5% Core/2.5 V $\pm$ 5% Output Operating Supply
 - ♦ Mixed 3.3 V $\pm$ 5% Core/1.8 V $\pm$ 0.2 V Output Operating Supply
 - ♦ Mixed 3.3 V $\pm$ 5% Core/1.5 V $\pm$ 0.15 V Output Operating Supply
 - ♦ Mixed 2.5 V $\pm$ 5% Core/ 1.8 V $\pm$ 0.2 V Output Operating Supply
 - ♦ Mixed 2.5 V $\pm$ 5% Core /1.5 V $\pm$ 0.15 V Output Operating Supply
- Industrial temp. range -40°C to 85°C
- These are Pb-Free Devices

Applications

- Clock Distribution
- Networking and Communications
- High End Computing
- Wireless and Wired Infrastructure

End Products

- Servers
- Ethernet Switch/Routers
- ATE
- Test and Measurement

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

4. XTAL_IN can be overdriven relative to a signal a crystal would provide.

5. Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at $V_{DDO}/2$.

6. This parameter is defined in accordance with JEDEC Standard 65.

7. See phase noise plot.

8. These parameters are guaranteed by characterization. Not tested in production. See Parameter Measurement Information

APPLICATION INFORMATION

Recommendations for Unused LVCMOS Output Pins

Inputs:

CLK/ $\overline{\text{CLK}}$ Inputs

For applications not requiring the use of the differential input, both CLK and $\overline{\text{CLK}}$ can be left floating. Though not required, but for additional protection, a 1 k Ω resistor can be tied from CLK to ground.

Crystal Inputs

For applications not requiring the use of the crystal oscillator input, both XTAL_IN and XTAL_OUT can be left

floating. Though not required, but for additional protection, a 1 k Ω resistor can be tied from XTAL_IN to ground.

LVCMOS Control Pins

All control pins have internal pulldowns; additional resistance is not required but can be added for additional protection. A 1 k Ω resistor can be used.

Outputs:

LVCMOS Outputs

All unused LVCMOS outputs can be left floating with no trace attached.

Differential Input with Single-Ended Interconnect

Refer to Figure 5 to interconnect a single-ended to a Differential Pair of inputs. The reference bias voltage $V_{REF} = V_{DD}/2$ is generated by the resistor divider of R3 and R4. Bypass capacitor (C1) can filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. Adjust R1 and R2 to common mode voltage of the signal input swing to preserve duty cycle.

This configuration requires that the sum of the output impedance of the driver (R_o) and the series resistance (R_s) equals the transmission line impedance. In addition, matched termination by R1 and R2 will attenuate the signal

amplitude in half. Termination may be done by using R_s or by using R1 and R2. First, $R_s = 0$ and then R3 and R4 in parallel should equal the transmission line impedance. For most 50 Ω applications, R1 and R2 can be 100 Ω . The differential input can handle full rail LVC MOS signaling, but it is recommended that the amplitude be reduced. The datasheet specifies a differential amplitude which needs to be doubled for a single ended equivalent stimulus. V_{ILmin} cannot be less than -0.3 V and V_{IHmax} cannot be more than $V_{DD} + 0.3$ V. The datasheet specifications are characterized and guaranteed by using a differential signal.

Figure 5. Differential Input with Single-ended Interconnect

Crystal Input Interface

The device has been characterized with 18 pF parallel resonant crystals. The capacitor values, C1 and C2, shown in Figure 6 below as 15 pF were determined using an 18 pF parallel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

Figure 6. Crystal Input Interface

CLOCK Overdriving the XTAL Interface

The XTAL_IN input can accept a single-ended LVC MOS signal through an AC coupling capacitor. A general LVC MOS interface diagram is shown in Figure 7 and a general LVPECL interface in Figure 8. The XTAL_OUT pin must be left floating. The maximum amplitude of the input signal should not exceed 2 V and the input edge rate can be as slow as 10 ns. This configuration requires that the output impedance of the driver (R_o) plus the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50 Ω applications, R1 and R2 can be 100 Ω . This can also be accomplished by removing R1 and making R2 50 Ω . By overdriving the crystal oscillator, the device will be functional, but note, the device performance is guaranteed by using a quartz crystal.

NB3F8L3010C

Figure 7. General Diagram for LVC MOS Driver to XTAL Input Interface Use R_S or $R1 / R2$

Figure 8. General Diagram for LVPECL Driver to XTAL Input Interface

Differential Clock Input Interface

The CLK / $\overline{\text{CLK}}$ accept LVDS, LVPECL, SSTL, HCSL differential signals. Signals must meet the V_{PP} and V_{CMR} input requirements. Figures 9 to 13 show interface examples for the CLK / $\overline{\text{CLK}}$ input with built-in 50 Ω terminations driven by the most common driver types. The

input interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in Figure 14. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts. While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as

“heat pipes”. The number of vias (i.e. “heat pipes”) is application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13 mils (0.30 to 0.33 mm) with 1 oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only.
