

5V Low Power RS232 Transceiver with 2 Receivers Active in Shutdown

FEATURES

- Operates from a Single 5V Supply
Low Supply Current: $I_{CC} = 220\mu A$
- $I_{CC} = 35\mu A$ in Shutdown Mode with Both Receivers Kept Alive
- ESD Protection Over $\pm 10kV$
- Uses Small Capacitors: $0.1\mu F$
- Operates to 120kbaud
- Output Overvoltage Does Not Force Current Back into Supplies
- RS232 I/O Lines Can Be Forced to $\pm 25V$ Without Damage
- Pin Compatible with LT1180A

APPLICATIONS

- Notebook Computers
- Palmtop Computers

DESCRIPTION

The LTC[®]1384 is an ultra-low power 2-driver/2-receiver RS232 transceiver that operates from a single 5V supply. The charge pump requires only four space-saving $0.1\mu F$ capacitors.

The transceiver operates in one of two modes, Normal and Shutdown. In the Normal mode, I_{CC} is only $220\mu A$ with the driver outputs unloaded. In the Shutdown mode, the charge pump is turned off, the driver outputs are forced into three-state, both receivers are kept active and I_{CC} drops to $35\mu A$. The receiver outputs may be forced into three-state at any time using the receiver enable (RX $\overline{EN}$) pin.

The LTC1384 is fully compliant with all data rate and overvoltage RS232 specifications. The transceiver can operate up to 120kbaud with a $2500pF$, $3k\Omega$ load. Both driver outputs and receiver inputs can be forced to $\pm 25V$ without damage and can survive multiple $\pm 10kV$ ESD strikes.

LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Quiescent and Shutdown Supply Current vs Temperature

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V_{CC})	6V
Input Voltage	
Driver	$-0.3V$ to $V_{CC} + 0.3V$
Receiver	$-25V$ to $25V$
Digital Input	$-0.3V$ to $V_{CC} + 0.3V$
Output Voltage	
Driver	$-25V$ to $25V$
Receiver	$-0.3V$ to $V_{CC} + 0.3V$

Short-Circuit Duration

V^+	30 sec
V^-	30 sec
Driver Output	Indefinite
Receiver Output	Indefinite

Operating Temperature Range

LTC1384C	$0^{\circ}C$ to $70^{\circ}C$
LTC1384I	$-40^{\circ}C$ to $85^{\circ}C$

Storage Temperature Range $-65^{\circ}C$ to $150^{\circ}C$

Lead Temperature (Soldering, 10 sec) $300^{\circ}C$

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 3: Measurements made in the Shutdown mode are performed with $V_{ON/OFF} = 0V$.

Note 2: Supply current is measured with driver and receiver outputs unloaded.

PIN FUNCTIONS

V_{CC}: 5V Input Supply Pin. This pin should be decoupled with a 0.1μF ceramic capacitor.

GND: Ground Pin.

ON/OFF: TTL/CMOS Compatible Shutdown Pin. A logic low puts the device in the Shutdown mode independent of the RX $\overline{\text{EN}}$ pin. The supply current of the device drops to 35μA (two receivers alive) and both driver outputs are forced into three-state.

RX $\overline{\text{EN}}$: TTL/CMOS Compatible Receiver Enable Pin. A logic high forces the receiver outputs into three-state. A logic low enables the receiver outputs.

V⁺: Positive Supply Output (RS232 Drivers). $V^+ \cong 2V_{CC} - 2V$. This pin requires an external capacitor $C = 0.1\mu\text{F}$ for charge storage. The capacitor may be tied to ground or V_{CC} . With multiple devices, the V^+ and V^- pins may share a common capacitor. For large numbers of devices, increasing the size of the shared common storage capacitors is recommended to reduce ripple.

V⁻: Negative Supply Output (RS232 Drivers). $V^- \cong -(2V_{CC} - 2V)$. This pin requires an external capacitor $C = 0.1\mu\text{F}$ for charge storage.

C1⁺, C1⁻, C2⁺, C2⁻: Commutating Capacitor Inputs. These pins require two external capacitors $C = 0.1\mu\text{F}$: one from C1⁺ to C1⁻ and another from C2⁺ to C2⁻. To maintain charge pump efficiency, the capacitor's effective series resistance should be less than 2Ω.

TR IN: RS232 Driver Input Pins. Inputs are TTL/CMOS compatible. The inputs of unused drivers can be left unconnected since 300k input pull-up resistors to V_{CC} are included on chip. To minimize power consumption, the internal driver pull-up resistors are disconnected from V_{CC} in the Shutdown mode.

TR OUT: Driver Outputs at RS232 Voltage Levels. Outputs are in a high impedance state when in the Shutdown or $V_{CC} = 0V$. The driver outputs are protected against ESD to ±10kV for human body model discharges.

RX IN: Receiver Inputs. These pins can be forced to ±25V without damage. The receiver inputs are protected against ESD to ±10kV for human body model discharges. Each receiver provides 0.4V of hysteresis for noise immunity.

RX OUT: Receiver Outputs with TTL/CMOS Voltage Levels. A logic high at RX $\overline{\text{EN}}$ puts the outputs into three-state.
