

SOT-26

Pin Definition:

1. GND
2. Gate
3. Current Sense
4. INV
5. Compensation
6. VDD

Description

TS19701A is a high performance offline PWM Power switch for low power AC/DC charger and adapter applications. It operates in primary-side sensing and regulation. Consequently, opto-coupler and TS431 could be eliminated. Proprietary Constant Voltage (CV) and Constant Current (CC) control is integrated as shown in the figure below. In CC control, the current and output power setting can be adjusted externally by the sense resistor R_s at CS pin. In CV control, multi-mode operations are utilized to achieve high performance and high efficiency. In addition, good load regulation is achieved by the built-in cable drop compensation. Device operates in PFM in CC mode as well at large load condition and it operates in PWM with frequency reduction at light/medium load. TS19701A offers power on soft start control and protection coverage with auto-recovery features including Cycle-by-Cycle current limiting, VDD OVP, VDD clamp and UVLO. Excellent EMI performance is achieved with Power-Source proprietary frequency shuffling technique. High precision constant voltage (CV) and constant current (CC) can be achieved by TS19701A

Features

- $\pm 5\%$ Constant Voltage Regulation at Universal AC input
- Primary-side Sensing and Regulation
- Programmable CV and CC Regulation
- Adjustable Constant Current and Output Power Setting
- Built-in Adaptive Current Peak Regulation
- Built-in Primary winding inductance compensation
- Programmable Cable drop Compensation
- Power on Soft-start
- Built-in Leading Edge Blanking (LEB)
- Cycle-by-Cycle Current Limiting
- VDD Under Voltage Lockout with Hysteresis

Application

- LED lighting
- Cell phone charger

Ordering Information

Part No.	Package	Packing
TS19701ACX6 RFG	SOT-26	3Kpcs / 7" Reel

Note: "G" denote for Halogen Free Product

Absolute Maximum Rating ($T_a = 25^\circ\text{C}$ unless otherwise noted)

Characteristics	Symbol	Rating	Unit
Drain Voltage (off state)	V_{DRAIN}	-0.3 to B_{Vdss}	V
VDD Voltage	V_{DD}	-0.3 to $V_{\text{DD_Clamp}}$	V
VDD Zener Clamp Continuous Current	--	10	mA
COMP Voltage	V_{COMP}	-0.3 to 7	V
CS Input Voltage	V_{CS}	-0.3 to 7	V
INV Input Voltage	V_{INV}	-0.3 to 7	V
Max Operating Junction Temperature	T_{J}	150	$^\circ\text{C}$
Min/Max Storage Temperature	T_{STG}	-55 to 150	$^\circ\text{C}$
Thermal Resistance from Junction to case	θ_{JC}	180	$^\circ\text{C/W}$
Thermal Resistance from Junction to ambient	θ_{JA}	250	$^\circ\text{C/W}$

Electrical Specifications (Ta = 25°C unless otherwise noted)

Characteristics	Symbol	Conditions	Min	Typ	Max	Units
Supply Voltage (VDD) Section						
Standby Current	I _{DD ST}	V _{DD} =13V	--	5	20	uA
Operation Current	I _{DD OP}	Operation supply current I _{NV} =2V, C _S =0V, V _{DD} =V _{DDG} =18V	--	2	3	mA
VDD Under Voltage Lockout Enter	U _{VLO(ON)}	V _{DD} falling	8.2	9.0	10.5	V
VDD Under Voltage Lockout Exit	U _{VLO(OFF)}	V _{DD} rising	13.5	14.8	16.0	V
Maximum VDD operation voltage	V _{DDClamp}	I _{DD} =10mA	27	28.5	30	V
Over Voltage protection voltage	OVP	Ramp V _{DD} until gate shut down	26	27.5	29	V
Current Sense Input Section						
LEB time	T _{LEB}		--	625	--	Ns
Over current threshold	V _{th_oc}		880	910	940	mV
OCP Propagation delay	T _{d_oc}		--	110	--	Ns
Input Impedance	Z _{SENSE_IN}		50	--	--	KΩ
Soft start time	T _{SS}		--	17	--	ms
Frequency Section						
IC Maximum frequency	Freq_Max	(Note)	55	60	65	KHZ
System Nominal switch frequency	Freq_Nom		--	50	--	KHZ
	Freq_startup	I _{NV} =0V, Comp=5V	--	14	--	KHZ
Frequency shuffling range	Δf/Freq		--	+/-6	--	%
Error Amplifier section						
Reference voltage for EA	V _{ref_EA}		1.97	2	2.03	V
DC gain of EA	Gain		-	60	-	dB
Max. Cable compensation current	I _{COMP_MAX}	I _{NV} =2V, Comp=0V	-	37.5	-	uA

Note: Freq_Max indicates IC internal maximum clock frequency. In system application, the maximum operation frequency of 60Khz nominal occurs at maximum output power or the transition point from CV to CC

Pin Description

Pin	Function	Description
1	GND	Ground
2	Gate	Drive MOSFET
3	CS	Current sense input
4	INV	The voltage feedback from auxiliary winding
5	COMP	Loop Compensation for CV Stability
6	VDD	Power Supply

Function Description

TS19701A is a cost effective PWM power switch optimized for off-line low power AC/DC applications including battery chargers and adapters. It operates in primary side sensing and regulation, thus opto-coupler and TL431 are not required. Proprietary built-in CV and CC control can achieve high precision CC/CV control meeting most adapter and charger application requirements.

Startup Current and Start up Control

Startup current of TS19701A is designed to be very low so that VDD could be charged up above UVLO threshold and starts up quickly. A large value startup resistor can therefore be used to minimize the power loss in application.

Operating Current

The Operating current of TS19701A is as low as 2.0mA. Good efficiency is achieved with the low operating current together with 'Muti-mode' control features.

Soft Start

TS19701A features an internal soft start to minimize the component electrical over-stress during power on startup. As soon as VDD reaches UVLO (OFF), the control algorithm will ramp peak current voltage threshold gradually from nearly zero to normal setting of 0.91V. Every restart is a soft start.

CC/CV Operation

TS19701A is designed to produce good CC/CV control characteristic as shown in the Fig. 1. In charger applications, a discharged battery charging starts in the CC portion of the curve until it is nearly full charged and smoothly switches to operate in CV portion of the curve. In an AC/DC adapter, the normal operation occurs only on the CV portion of the curve. The CC portion provides output current limiting. In CV operation, the output voltage is regulated through the primary side control. In CC operation mode, TS19701A will regulate the output current constant regardless of the output voltage drop.

Principle of Operation

To support TS19701A proprietary CC/CV control, system needs to be designed in DCM mode for flyback system (Refer to Typical Application Diagram on page1). In the DCM flyback converter, the output voltage can be sensed via the auxiliary winding. During MOSFET turn-on time, the load current is supplied from the output filter capacitor Co. The current in the primary winding ramps up. When MOSFET turns off, the primary current transfers to the secondary at the amplitude of

$$I_s = \frac{N_P}{N_S} \cdot I_P \quad (1)$$

The auxiliary voltage reflects the output voltage as shown in fig.2 and it is given by

$$V_{AUX} = \frac{N_{AUX}}{N_S} \cdot (V_O + \Delta V) \quad (2)$$

Where ΔV indicates the drop voltage of the output Diode.

Function Description (Continue)

Fig.2. Auxiliary voltage waveform

Via a resistor divider connected between the auxiliary winding and INV (pin 4), the auxiliary voltage is Sampled at the end of the demagnetization and it is hold until the next sampling. The sampled voltage is compared with V_{ref} (2.0V) and the error is amplified. The error amplifier output COMP reflects the load condition and controls the PWM switching frequency to regulate the output voltage, thus constant output voltage can be achieved. When sampled voltage is below V_{ref} and the error amplifier output COMP reaches its maximum, the switching frequency is controlled by the sampled voltage thus the output voltage to regulate the output current, thus the constant output current can be achieved.

Adjustable CC point and Output Power

In TS19701A, the CC point and maximum output power can be externally adjusted by external current sense resistor R_s at CS pin as illustrated in Typical Application Diagram. The output power is adjusted through CC point change. The larger R_s , the smaller CC point is, and the smaller output power becomes, and vice versa as shown in Fig.3

Fig.3 Adjustable output power by changing R_s

Function Description (Continue)

Operation switching frequency

The switching frequency of TS19701A is adaptively controlled according to the load conditions and the operation modes. No external frequency setting components are required. The operation switching frequency at maximum output power is set to 60KHz internally.

For flyback operating in DCM, The maximum output power is given by

$$PO_{MAX} = \frac{1}{2} L_p F_{SW} I_p^2 \quad (3)$$

Where L_p indicate the inductance of primary winding and I_p is the peak current of primary winding. Refer to the equation 3, the change of the primary winding inductance results in the change of the maximum output power and the constant output current in CC mode. To compensate the change from variations of primary winding inductance, the switching frequency is locked by an internal loop such that the switching frequency is

$$F_{SW} = \frac{1}{2T_{Demag}} \quad (4)$$

Since T_{Demag} is inversely proportional to the inductance, as a result, the product L_p and f_{sw} is constant, thus the maximum output power and constant current in CC mode will not change as primary winding inductance changes. Up to $\pm 10\%$ variation of the primary winding inductance can be compensated. Frequency shuffling for EMI improvement the frequency shuffling (switching frequency modulation) is implemented in TS19701A. The oscillation frequency is modulated so that the tone energy is spread out. The spread spectrum minimizes the conduction band EMI and therefore eases the system design.

Current Sensing and Leading Edge Blanking

Cycle-by-Cycle current limiting is offered in TS19701A current mode PWM control. The switch current is detected by a sense resistor into the CS pin. An internal leading edge blanking circuit chops off the sensed voltage spike at initial internal power MOSFET on state so that the external RC filtering on sense input is no longer needed. The PWM duty cycle is determined by the current sense input voltage and the EA output voltage.

Gate Drive

The internal power MOSFET in TS19701A is driven by a dedicated gate driver for power switch control. Too weak the gate drive strength results in higher conduction and switch loss of MOSFET while too strong gate drive compromises EMI. A good tradeoff is achieved through the built-in totem pole gate design with right output strength control.

Programmable Cable drop Compensation

In TS19701A, cable drop compensation is implemented to achieve good load regulation. An offset voltage is generated at INV by an internal current flowing into the resistor divider. The current is inversely proportional to the voltage across pin COMP, as a result, it is inversely proportional to the output load current, thus the drop due to the cable loss can be compensated. As the load current decreases from full-load to no-load, the offset voltage at INV will increase. It can also be programmed by adjusting the resistance of the divider to compensate the drop for various cable lines used.

Function Description (Continue)

Protection Control

Good power supply system reliability is achieved with its rich protection features including Cycle-by-Cycle current limiting (OCP), VDD clamp, Power on Soft Start, and Under Voltage Lockout on VDD (UVLO).

VDD is supplied by transformer auxiliary winding output. The output of TS19701A is shut down when VDD drops below UVLO (ON) limit and Switcher enters power on start-up sequence thereafter.
