

Low noise quad operational amplifier

Features

- Low voltage noise: $4.5\text{nV}/\sqrt{\text{Hz}}$
- High gain bandwidth product: 15MHz
- High slew rate: $7\text{V}/\mu\text{s}$
- Low distortion: 0.002%
- Large output voltage swing: $+14.3\text{V}/-14.6\text{V}$
- Excellent frequency stability
- ESD protection 2kV
- Macromodel included in this specification

Description

The MC33079 is a monolithic quad operational amplifier particularly well suited for audio applications.

It offers low voltage noise ($4.5\text{nV}/\sqrt{\text{Hz}}$) and high frequency performance (15MHz gain bandwidth product, $7\text{V}/\mu\text{s}$ slew rate).

In addition the MC33079 has a very low distortion (0.002%) and excellent phase/gain margins.

The output stage allows a large output voltage swing and symmetrical source and sink currents.

T_{stg}	Storage temperature	-65 to +150	°C
R_{thja}	Thermal resistance junction to ambient ^{(2) (3)} DIP14 SO-14	80 105	°C/W
R_{thjc}	Thermal resistance junction to case ^{(2) (3)} DIP14 SO-14	33 31	°C/W
ESD	HBM: human body model ⁽⁴⁾	1	kV
	MM: machine model ⁽⁵⁾	200	V
	CDM: charged device model ⁽⁶⁾	1.5	kV

1. Either or both input voltages must not exceed the magnitude of V_{CC}^+ or V_{CC}^- .
2. Short-circuits can cause excessive heating. Destructive dissipation can result from simultaneous short-circuits on all amplifiers.
3. R_{th} are typical values.
4. Human body model: 100pF discharged through a 1.5k Ω resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
5. Machine model: a 200pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
6. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to the ground.

4 Macromodel

4.1 Important note concerning this macromodel

Please consider the following remarks before using this macromodel.

- All models are a trade-off between accuracy and complexity (i.e. simulation time).
- Macromodels are not a substitute to breadboarding; rather, they confirm the validity of a design approach and help to select surrounding component values.
- A macromodel emulates the **nominal** performance of a **typical** device within **specified operating conditions** (temperature, supply voltage, for example, see [Table 4](#)). Thus the macromodel is often not as exhaustive as the datasheet, its purpose is to illustrate the main parameters of the product.

Data derived from macromodels used outside of the specified conditions (V_{CC} , temperature, for example) or even worse, outside of the device operating conditions (V_{CC} , V_{icm} , for example), is not reliable in any way.

4.2 Electrical characteristics for macromodel

5 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK[®] packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
