

40V, Ultra-Low Quiescent-Current Linear Regulators in 6-Pin TDFN/8-Pin SO

General Description

The MAX15006/MAX15007 ultra-low quiescent-current linear regulators are ideal for use in automotive and battery-operated systems. These devices operate from an input voltage of 4V to 40V, deliver up to 50mA of output current, and consume only 10 μ A of quiescent current at no load. The internal p-channel pass device keeps the quiescent current low even at full load. The MAX15007 consumes only 3 μ A current when in shutdown.

The MAX15006A/MAX15007A have a fixed 3.3V output while the MAX15006B/MAX15007B have a fixed 5V output voltage. The MAX15007 includes an enable input to turn the device on or off. All devices are short-circuit protected and include thermal shutdown.

The MAX15006/MAX15007 operate over the -40°C to +125°C automotive temperature range. These devices are available in space-saving 3mm x 3mm 6-pin TDFN and 8-pin SO thermally enhanced packages.

Applications

Automotive
Tire-Pressure Monitoring
Industrial
Telecom
Networking

Features

- ◆ Wide Operating Input Voltage Range (4V to 40V)
- ◆ Guaranteed 50mA Output Current
- ◆ Low Quiescent Current
10 μ A (No Load) and 90 μ A (Full Load)
- ◆ Operates Through Cold-Crank Condition
- ◆ Withstands 45V Load Dump
- ◆ Low Dropout Voltage of 300mV (MAX15006B/MAX15007B)
- ◆ Stable Operation with Tiny 2.2 μ F Output Capacitor
- ◆ Enable Input (MAX15007)
- ◆ Preset 3.3V and 5.0V Output Voltages
- ◆ Thermal and Short-Circuit Protection
- ◆ -40°C to +125°C Operating Temperature Range
- ◆ Thermally Enhanced 3mm x 3mm 6-Pin TDFN/ 8-Pin SO Packages

Enable Threshold Voltage	V_{IL}			0.4		V
	V_{IH}		1.4			
Enable Threshold Hysteresis				60		mV
Enable Pulldown Current		Internally pulled down to GND		0.5		μA
Enable to Regulation Time		(Note 5)		0.4	2	ms
THERMAL SHUTDOWN						
Thermal Shutdown	T_{SHDN}	Junction temperature rising		+165		$^{\circ}C$
Thermal Shutdown Hysteresis	T_{HYST}			20		$^{\circ}C$

Note 1: Limits at $-40^{\circ}C$ are guaranteed by design.

Note 2: Output voltage regulation is guaranteed for $I_{OUT} \geq 5\mu A$.

Note 3: Dropout voltage is defined as ($V_{IN} - V_{OUT}$) when V_{OUT} is 2% below the value of V_{OUT} when $V_{IN} = V_{OUT} + 3V$.

Note 4: For $V_{OUT} = 3.3V$, the 700mV dropout indicates V_{OUT} does not reach 2% below V_{OUT} at $V_{IN} = V_{OUT} + 3V$ at minimum 4V input voltage.

Note 5: Enable to regulation time is the time the output takes to reach 95% of its final value with $V_{IN} = 14V$ and EN is taken from V_{IL} to V_{IH} in 5ns.

MAX15006/MAX15007

Pin Description

PIN				NAME	FUNCTION
MAX15006		MAX15007			
TDFN	SO	TDFN	SO		
1, 2	1	1, 2	1	IN	Regulator Supply Input. Supply voltage ranges from 4V to 40V. Bypass with a 0.1μF capacitor to GND.
3	2, 3, 4, 6, 7	—	2, 4, 6, 7	N.C.	No Connection. Not internally connected.
4	5	4	5	GND	Ground
5, 6	8	5, 6	8	OUT	Regulator Output. Bypass OUT to GND with a low-ESR capacitor with a minimum 2.2μF.
—	—	3	3	EN	Active-High Enable Input. Force EN high (or connect to V _{IN}) to turn the regulator on. Pull EN low (or leave unconnected) to place the device in a low-power shutdown mode. EN is internally pulled down to GND through a 0.5μA sink current.
EP	EP	EP	EP	EP	Exposed Pad. Internally connected to GND. Connect EP to the ground plane for enhanced thermal performance. Do not use EP as a ground connection.

The schematic diagram illustrates the internal architecture of the MAX15006 precision current source. It features an input terminal (IN) and a ground terminal (GND). The circuit includes a thermal sensor and a 1.242V reference voltage source. These components are connected to an error amplifier, which in turn drives a FET driver with current limit. The FET driver controls a MOSFET, which is connected to a load resistor. The output (OUT) is measured across the load resistor. The MAXIM MAX15006 logo is located at the bottom right of the diagram.

The block diagram illustrates the internal architecture of the MAX15007. It features three main input pins: IN, EN, and GND. The IN pin is connected to a switch that can route the input signal to either the non-inverting input of the error amplifier or the gate of the FET driver. The EN pin is connected to the CONTROL LOGIC block. The GND pin is connected to the common ground. The internal components include a CONTROL LOGIC block, a THERMAL SENSOR, a 1.242V REF (reference voltage), an ERROR AMPLIFIER, a FET DRIVER WITH CURRENT LIMIT, and an output FET. The output FET is connected to the OUT pin and a load resistor. The MAXIM logo and the part number MAX15007 are shown at the bottom right.

MAXIM

40V, Ultra-Low Quiescent-Current Linear Regulators in 6-Pin TDFN/8-Pin SO

Detailed Description

The MAX15006/MAX15007 high-voltage linear regulators operate over a 4V to 40V input voltage range. These devices guarantee 50mA load drive, and offer preset output voltages of +3.3V or +5V. Thermal shutdown and short-circuit protection prevent damage during overtemperature and overcurrent conditions. The MAX15007 includes an enable input (EN) allowing the regulators to be turned on/off using a logic-level voltage. Driving EN high turns on the device while driving EN low places the device in a low-power shutdown mode. In shutdown, the supply current is reduced to 3 μ A (typ). The MAX15006/MAX15007 operate over the -40°C to +125°C automotive temperature range. All devices are available in thermally enhanced 6-pin TDFN and 8-pin SO packages capable of dissipating 1.904W and 1.860W at $T_A = +70^\circ\text{C}$, respectively.

Regulator

The regulator accepts an input voltage from 4V to 40V. The MAX15006A/MAX15007A have a fixed 3.3V output voltage while the MAX15006B/MAX15007B offer a fixed 5V output voltage.

EN Input (MAX15007 Only)

EN is an active-high, logic-level enable input that turns the device on or off. Drive EN high to turn the device on. An internal 0.5 μ A pulldown current keeps the MAX15007 in shutdown mode when driven by a three-

state driver in high-impedance mode, or an open-drain driver. While in shutdown, the device consumes only 3 μ A (typ). EN withstands voltages up to 40V, allowing it to be driven by high input level voltages or connected to IN for always-on operation.

Thermal Protection

When the junction temperature exceeds +165°C, an internal thermal sensor turns the pass transistor off, and allows the device to cool. The thermal sensor turns the pass transistor on again after the junction temperature cools by 20°C. This results in a cycled output during continuous thermal-overload conditions. Thermal protection protects the MAX15006/MAX15007 in the event of fault conditions. Operation at $T_J = +150^\circ\text{C}$ without going into thermal shutdown is not guaranteed. Use Figures 3a and 3b to determine the minimum guaranteed output current.

Output Short-Circuit Current Limit

The MAX15006/MAX15007 feature a 175mA current limit. The output can be shorted to GND for an indefinite period of time without damage to the device. During a short circuit, the power dissipated across the pass transistor can quickly heat the device. When the die temperature reaches +165°C, the MAX15006/MAX15007 shut down and automatically restart after the die temperature cools by 20°C.

Figure 3a. Minimum Output Current vs. Ambient Temperature (6-Pin TDFN-EP)

Figure 3b. Minimum Output Current vs. Ambient Temperature (8-Pin SO-EP)

40V, Ultra-Low Quiescent-Current Linear Regulators in 6-Pin TDFN/8-Pin SO

Applications Information

Available Output Current Calculation

The MAX15006/MAX15007 provide up to 50mA of continuous output current. The input voltage range extends to 40V. Package power dissipation limits the amount of output current available for a given input/output voltage and ambient temperature. Figure 4 shows the maximum allowable power dissipation for these devices to keep the junction temperature below +150°C. Figure 4 assumes that the exposed metal pad of the MAX15006/MAX15007 is soldered to 1in² of PCB copper.

Figure 4. Calculated Maximum Power Dissipation vs. Ambient Temperature

Use Figure 4 to determine the allowable package dissipation for a given ambient temperature. Alternately, use the following formulas to calculate the allowable package dissipation. For the TDFN package:

$$P_D = \begin{cases} 1.9048W & \text{for } T_A \leq +70^\circ\text{C} \\ 1.9048W - 0.0238 \frac{W}{^\circ\text{C}} \times (T_A - 70^\circ\text{C}) & \text{for } +70^\circ\text{C} < T_A \leq +125^\circ\text{C} \end{cases}$$

For the SO-EP package:

$$P_D = \begin{cases} 1.8605W & \text{for } T_A \leq +70^\circ\text{C} \\ 1.8605W - 0.0233 \frac{W}{^\circ\text{C}} \times (T_A - 70^\circ\text{C}) & \text{for } +70^\circ\text{C} < T_A \leq +125^\circ\text{C} \end{cases}$$

After determining the allowable package dissipation, calculate the maximum allowable output current, without exceeding the +150°C junction temperature, using the following formula:

$$I_{OUT(MAX)} = \frac{P_D}{V_{IN} - V_{OUT}} \leq 50\text{mA}$$

The above equations do not include the negligible power dissipation from self-heating due to the IC ground current.

Example 1 (TDFN Package):

$$T_A = +125^\circ\text{C}$$

$$V_{IN} = 26\text{V}$$

$$V_{OUT} = 3.3\text{V}$$

Calculate the maximum allowable package dissipation at the given temperature as follows:

$$P_D = 1.9048W - 0.0238 \frac{W}{^\circ\text{C}} (125^\circ\text{C} - 70^\circ\text{C}) = 595.8\text{mW}$$

And establish the maximum output current:

$$I_{OUT(MAX)} = \frac{595.8\text{mW}}{26\text{V} - 3.3\text{V}} = 26.2\text{mA}$$

Example 2 (TDFN Package):

$$T_A = +85^\circ\text{C}$$

$$V_{IN} = 14\text{V}$$

$$V_{OUT} = 5\text{V}$$

Calculate the maximum allowable package dissipation at the given temperature as follows:

$$P_D = 1.9048W - 0.0238 \frac{W}{^\circ\text{C}} (85^\circ\text{C} - 70^\circ\text{C}) = 1.5478W$$

40V, Ultra-Low Quiescent-Current Linear Regulators in 6-Pin TDFN/8-Pin SO

Then determine the maximum output current:

$$I_{OUT(MAX)} = \frac{1.5478W}{14V-5V} = 172mA \Rightarrow I_{OUT(MAX)} = 50mA$$

Example 3 (TDFN Package):

$T_A = +50^\circ C$

$V_{IN} = 9V$

$V_{OUT} = 5V$

Calculate the maximum allowable package dissipation at the given temperature as follows:

$$P_D = 1.9048W$$

Find the maximum output current:

$$I_{OUT(MAX)} = \frac{1.9048W}{9V-5V} = 476mA \Rightarrow I_{OUT(MAX)} = 50mA$$

In Examples 2 and 3, the maximum output current is calculated as 172mA and 476mA, respectively; however, the allowable output current cannot exceed 50mA.

Alternately, use Figures 5a and 5b to quickly determine the maximum allowable output current for selected ambient temperatures and input voltages.

Output-Capacitor Selection and Regulator Stability

For stable operation over the full temperature range and with load currents up to 50mA, use a low-ESR 2.2 μF (min) ceramic or tantalum output capacitor. Use larger output-capacitor values such as 22 μF to reduce noise, improve load-transient response, and power-supply rejection.

Some ceramic dielectrics exhibit large capacitance and ESR variations with temperature. Ensure the minimum capacitance under worst-case conditions does not drop below 1.3 μF to ensure output stability. With an X7R dielectric, 2.2 μF should be sufficient at all operating temperatures.
