The Key to Efficient Materials Handling

The issue of materials flow is of vital importance within today's fast-paced business environment. The areas of production and sales are faced with complex procurement and distribution networks, highly diversified product ranges and customer requirements that call for tailor-made solutions. Indeed, against the backdrop of shorter innovation cycles, increasingly complex manufacturing processes and new channels of distribution, materials flow has become a critical success factor. Globalisation has brought about substantial changes when it comes to the handling and delivery of goods – with far-reaching consequences for companies' logistical processes. "Internet fulfillment" has forced companies to embrace the values of customer-orientated flexibility and greater efficiency. The products of the Interroll Group play a pivotal role in helping companies meet the new challenges of materials handling.

Our main focus within the Drives and Rollers unit is on the individual parts which make up an overall product offering that is more than convincing. Indeed, components are our core competence. As an integral part of Interroll's cutting-edge solutions, our conveyor rollers contribute to the overall efficiency and quality of materials handling – in all industries, throughout the world. Conveyor rollers, multi-directional Omni-wheels and ball transfers – Interroll Drives and Rollers stands for poetry in motion. Our systems move, convey, accumulate, feed and turn – day in, day out; whether motorized or in the form of gravity rollers, accumulating conveyor systems or tapered rollers. Interroll components form the basis for efficient materials handling.

Interroll Drives & Rollers.
A Business Unit of the
Interroll Worldwide Group.

General Technical Information

This catalog contains components offering solutions to a number of conveying problems. Our design facilities and material handling expertise are at your disposal for special tasks and applications. This catalog will assist you in answering questions on determining how goods can be conveyed efficiently, economically and safely.

Initially you should determine the dimensions, weight and other characteristics of the goods to be conveyed. It is also very important to know if special ambient conditions apply.

Therefore please have the following information:

- length, width and height of product to be conveyed
- unit load weight
- the condition of the product in general
- the condition of the carrying surface of the product
- are there special environmental conditions: (i.e., humidity, extreme temperatures, chemical influences)?
- is static electricity likely to be a problem?
- is the conveyor installation to be powered or gravity operated?

To guarantee trouble free transportation of conveyed goods, a minimum of three rollers must be in contact with the carrying surface of product at any time.

The length of the rollers (roller length = RL in this catalog) should be determined. This is usually the “width of the conveyed material plus two inches (2").” The weight of the conveyed products should be distributed evenly on as many rollers as the admissible load capacity of the individual rollers will allow (see load capacities of Interroll conveyor rollers). This may require that more than three rollers should be in contact with the goods being conveyed.

Equally important is the condition and construction of the product to be conveyed, especially the carrying surface which is in direct contact with the conveyor. For example, plastic tote boxes move easily on rollers or wheels, because of their rigid bottom surface. Soft cardboard cartons have a higher starting resistance, than that for plastic totes. Therefore closer roller/wheel centers and/or larger roller/wheel diameters should be chosen. When transporting pallets, because of irregularities of the boards or specific properties of the pallet, from one/third to two/thirds of the rollers carry the load.

Warranty Information

Goods furnished are warranted to be free from all latent defects in material and workmanship under normal use and service for the time indicated below. For full Terms and Conditions please call 800-830-9680 or visit our website: www.interroll.us

The permissible loads for each roller are shown in the tables for the appropriate series of roller. Roller load capacity is largely influenced by roller length, load distribution and spindle attachment.

Rollers

- Two years from date of invoice.

Load Capacity of Interroll Conveyor Rollers

The load capacity of Interroll conveyor rollers depends on load capacity of the roller components: bearing, tube, or shaft.

To determine the roller load capacity, the load capacity of each component has to be compared and calculated in combination. The lowest value determines the load capacity of the roller. The load capacity values for each roller are listed along with the respective series description. The roller load capacity is critically influenced by the roller length, the load distribution and the shaft design.

When designing a conveyor installation, be aware that when using driven rollers, the calculated load capacity quite often is limited, not by load, but by such factors as the admissible tension of the drive chain or the torque of an accumulating system. Load capacity specifications depending on roller length have been based on the following conditions:
The load is considered to be a uniformly distributed load.

The allowable deflection of the tube can reach values of up to .02" for tubes of a diameter up to 1.18", up to .03" for tubes of a diameter between 1.18" and 3" and up to .04" for tubes with a diameter above 3".

The allowed tube stress amounts to 13450 psi for steel tube, 10100 psi for aluminum tube and 720 psi for PVC tube.

The bearing deflection angle should be limited to a maximum of 0°.40' (zero degrees, 40 minutes) for a deep groove ball bearing with C3 fit and a maximum of 1° for a commercial grade bearing.

The allowed shaft stress amounts to 19200 psi.

Roller tube group
The load capacity of the roller tube group itself is defined by two conditions:

the bending stress in the tube has to be less than the limit allowed for the material used.

$$\sigma\,\textbf{(tube)} = \frac{\textbf{Mb}}{\textbf{W}} = \frac{\textbf{F*RL}}{\textbf{8*W}} \leq \sigma\,\textbf{permissible}$$

The maximum deflection of the tube should not exceed the given value (Interroll calculations are based on the roller diameter, with a maximum deflection of 1 inch)

$$ft = \frac{5*F*RL3}{384*E*I}$$

The load capacity of the tube is influenced by the distribution of the load on its surface. The load distribution can vary from a concentrated loading up to a load uniformly distributed over the whole surface of the tube. The values given in the load capacity charts refer to the load distributed uniformly; concentrated load calculations are available on request.

The load capacity of the roller tube with load uniformly distributed is much higher than with a concentrated load. If point loading occurs close to the bearings, the data that is valid for the uniformly distributed load may be used.
Interroll supplies rollers with roller tubes made of copolymer, aluminum, carbon steel or stainless steel.

Shaft Group

For this group one condition determines the load capacity of the group:
The stress in the shaft must be less than the limit value fixed for the material.

$$\sigma\,\textbf{(shaft)} = \frac{Mb}{W} = \frac{F*(EL-RL)}{4*W} \leq \textbf{permissible}$$

There are a large number of possible shaft versions, but generally they may be divided into two categories: rigidly fixed in the conveyor frame or floating. Spring loaded shafts or shafts with milled flats are floating and fast to install. Male and female threaded shafts are rigidly secured directly to the conveyor frame, providing a higher load capacity for the roller. Load capacity is also influenced by the strength and rigidity of the conveyor frame.

Assembly load capacity values for shaft assemblies are shown for both floating and fixed mounting. The conditions for threaded attachment, in a theoretical sense, are only applicable for extremely rigid conveyor structures. When using less rigid structures, reductions of the given roller loading generally have to be made.

Bearing group

Interroll refers to the two bearings used in the roller, as well as the appropriate end caps, hardware and sealing elements as a bearing “group.” When selecting the appropriate bearing “group” the following points must be checked:

What is predominate, the static or dynamic load? (Static loading refers, for example, to a storage application whereas driven conveyor installations are viewed as dynamically loaded)
How fast is the conveyor speed? The conveying speed V in ft/sec. or ft/min. is primarily determined by the required conveying performance through-put.

The loading capacity of the bearing group is limited by the load capacity of the bearing and of the roller’s end cap. The deflection of either the shaft or tube can cause the bearing to wear out quickly. This deflection determines, in many cases, allowable loading on the roller. Admissible loading values have been determined empirically, and can be found in the technical data of the corresponding roller series.

Standard Assemblies for Rollers

Standard Types of Tube

Steel Tube
As tube material, steel has the greatest rigidity and resistance to deflection. Zinc plated, galvanized steel or stainless steel tubes provide protection against corrosion. Sprockets, gears or flanges can be welded onto the tube. Special designs are available including: grooved tubes for round belts; PVC sleeved tubes; and polyurethane sleeved tubes.

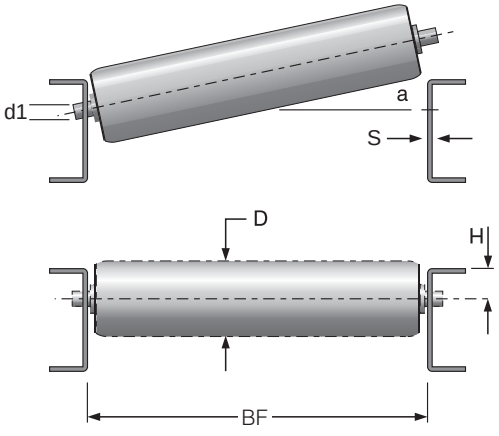
Aluminum tubes
Compared with the steel tube, an aluminum tube has reduced rigidity, approximately one-third of the flexural resistance of steel. An aluminum tube, however, weighs only 36% of a comparable steel tube. Aluminum tubes are corrosion resistant.

Plastic (Copolymer) tube
Assuming a comparable diameter, the load capacity of a steel tube is much higher than that of a PVC-copolymer tube. However, PVC tubes offer substantial advantages:

- sound insulation
- high impact resistance
- lightweight
- corrosion resistance
- easy to clean

Standard Shaft Designs

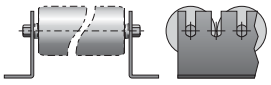
Spring loaded shafts
Spring loaded shafts are the simplest design, and are very quick and easy to install and remove. Spring loaded shafts are usually installed in gravity rollers for light and medium weight goods. The assembly holes in the frame should be at least .02" larger than the diameter of the shaft; the two frame members have to be rigidly connected with tie-bars to ensure parallelism. The shafts are not secured against rotation (except for hexagon shafts). Be sure that the between frame (BF) width is at least .12" wider than the overall roller length (RL). The installation space has to be enough to install the rollers in the side frames.



d1 - required hole diameter
S - frame wall thickness
H - distance between top of frame to center line of mounting hole
D - roller diameter
BF - distance between frame
d - roller shaft diameter

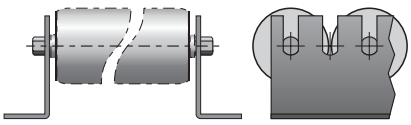
The circumstances and the formula shown in the illustration must be considered. An overall dimension of d1 to shaft diameter of approximately .02" is enough in most cases.

$$d1 \geq \frac{S \times (H + D/2)}{(BF - 1)} + d$$



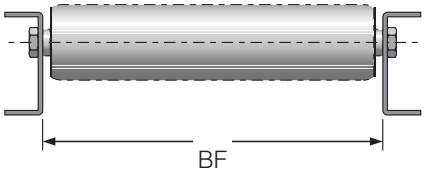
Taperhex shafts
The award winning TAPERHEX® Gold shaft is a patented spring-load design with self-adjusting hexagonal tapered shuttles. Tension from the spring causes the shuttle to lock in the conveyor frame's mounting holes. Roller rattling—the leading cause of roller shaft and side frame wear—is eliminated.

Shafts with milled flats
In this case we are talking about a floating or drop-in shaft, where the shaft is secured against rotation. The rollers can be easily assembled and disassembled utilizing an appropriate frame with open slots. The two frame members have to be rigidly spaced with tie bars, and the frame width has to be at least .12" wider than the overall roller length (RL).

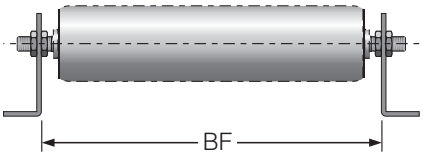


Female tapped shaft
Assembly with screws or bolts guarantees a very stable frame design, ideal for medium and heavy loads. Problems of shaft movement, with accompanying vibration and noise are completely eliminated. Roller shafts and frames work together, so that a higher load on the roller is possible compared with drop-in shafts.

In addition, the need and cost of tie bars is eliminated. Rollers are easily installed in an existing frame, if replacement is required. In addition, the need and cost of tie bars is eliminated. Rollers are easily installed in an existing frame, if replacement is required.



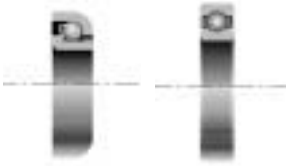
Male threaded shafts
This shaft design is installed in the frame with nuts. The characteristics are comparable to the female tapped design. However, the subsequent assembly and disassembly of the roller often cause problems.



Standard Types of Bearing

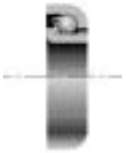
Various bearings are available for many Interroll conveyor rollers.
The most common types are:

Commercial grade bearing without ball retainer
This simply designed bearing has a relatively high load capacity. Compared to precision ball bearings, this bearing is extremely tolerant of shaft deflection.



Commercial grade bearing in stainless steel
This bearing is comparable to the commercial grade bearing but is totally made of stainless steel. This bearing version has reduced speed ratings and load capacity. It is corrosion resistant.

Precision grooved ball bearing according to ABEC-1 specification
This is a standard ABEC-1 deep groove ball bearing series 6000 and 6200. This bearing version offers precise operation, reduced noise, higher load capacity and a long life span.



Precision ball bearing ZZ
This version is similar to the previously described precision ball bearing design, but has steel shields on both sides. The shields create a narrow sealing gap and do not make contact. The shields retain the grease inside the bearing and provide mild protection against entry of dirt and dust particles but not against liquids.

Precision ball bearing 2RS
This version is similar to the previously described precision ball bearing, but has seals on both sides practically sealing the bearing hermetically. However, running torque of the bearing is somewhat higher, a real consideration for gravity applications and marginally power driven conveyors.

Bearing lubrication
Oiled bearings are generally used in gravity applications requiring a low coefficient of friction. The temperature range of standard oil is 0° to 200° F.

Grease packed bearings are generally used in powered applications. The temperature range of standard grease is -10° to 225° F. They are suitable for higher humidity applications.

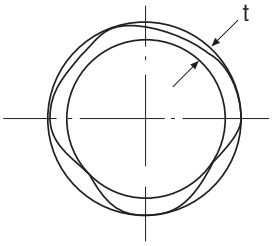
Interroll does not recommend the use of precision bearings in washdown applications.

Concentricity

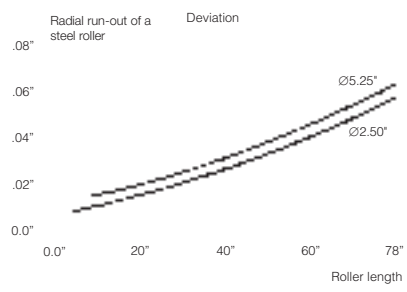
Interroll produces rollers from tubes following ANSI standards. This norm accepts certain divergence in the concentricity. Specifications on concentricity of tubes, all points of the measured surface have to be situated inside of two concentric cylinders. The center, respective to the axis of this cylinder is situated on the reference axis. The dimension “t” represents the distance between the two cylinders.
For example, according to specifications radial run-out (t) = .012" i.e. the pointer of a dial gauge can move within an area of .012".
The diagram determines the standard values for the maximum radial run-out of an Interroll conveyor roller. The given data is based on measured values.
Please note that for the tube area alone the concentricity tolerances are partly higher, so that in some cases the above mentioned data can be exceeded.

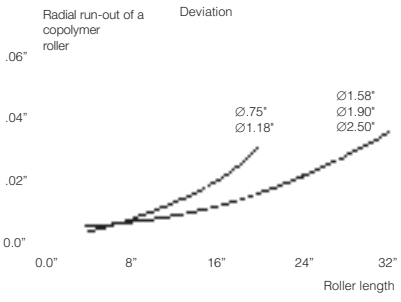
Rollers with polymer tubes should not exceed a given length, otherwise the radial run-out is proportionally larger. The following tube lengths should not be exceeded:

Tube Diameter	Tube Length
• .787"	14.00"
• 1.18"	21.00"
• 1.9"	23.00"
• 2.5"	31.00"
• 3.50"	39.00"



Note: Not applicable to series 1900 and 3900 welded rollers. Please contact the factory for more information.





Different Types of Industrial Plastics

Interroll uses plastic for many conveyor component parts. Plastic material has many advantages when compared to steel:

Sound reduction
Rollers with plastic components comply with the demands in internal transport for a quiet and pleasant working environment.

Light weight
Because the plastic tube is much lighter, the total weight of the conveyor installation will be substantially lower. Portable conveyors will be lighter and freight costs can be reduced.

Easy cleaning
In many processing applications, conveyor installations must be cleaned regularly. Interroll plastic rollers can be cleaned with most commercially available cleaning detergents (the temperature resistance of the plastic tube of up to 120°F should be taken into consideration as well as the use of stainless steel parts).

Shock resistant
An inherent property of most plastics is the ability to absorb shock loads or sudden impact without denting or deforming. The plastic materials used by Interroll are highly resistant to shock and to impact loads.

Corrosion resistance
Plastic does not rust. Bearings can be manufactured as well as the shafts from non-corroding steel. Therefore rollers with plastic tubes can run constantly in very wet and corrosive conditions.

Resistance to chemicals
The plastic materials used by Interroll have been selected to give optimum resistance against chemical attack. Plastic materials are resistant to grease, oil and petroleum products. We will be pleased to check special applications for you based on operating temperatures, chemical concentration, loading required, etc.

Approximate Figures

Property	Unit	Polyamide 6 (Nylon)	Polyoxymethylene (acetal)	Polypropylene	PVC	Polyethylene

It refers to an environmental temperature of 68° and a relative air humidity of 65%
For special applications please contact our engineering department.
* Copolymer 14 to 176°. Homocopolymer 32 to 176°
**Excluding POM with molybdenum sulphide

Temperature range

The ambient temperature has an impact on the mechanical features of any material. Changes of the mechanical features (load capacity, shock resistance) may occur. Optimal conditions prevail at room temperature. The listed temperature ranges are guide values, and may also be influenced by the following conditions:

Duration of the temperature influence
- type of mechanical load (direction of force, shocks, etc.)
- air humidity, solar radiation (UV)
- chemical influences
- component geometry

Properties and examples of the most common plastics:

Polyamide (PA) Nylon
- excellent mechanical properties
- high resistance to wear
- low friction
- scarcely any material fatigue
- good resistance to chemicals
- applications: sprocket heads, seals and bearing houses

Polypropylene (PP)
- low specific weight
- high resistance to heat
- good resistance to chemicals
- non-hydroscopic
- applications: wheels, seals, and bearing houses
- available in anti-static version

Polyvinyl Chloride (PVC)
- scratch proof
- impact resistance
- good resistance to chemicals
- applications: tubes for PVC rollers

Polyoxymethylene (POM) Acetal
- excellent mechanical properties
- high resistance to wear
- low friction
- high dimensional stability
- scarcely any water absorption
- used for parts with special precision requirements
- applications: toothed belt heads and slide bearings

Polyethylene (PE)
- excellent resistance to chemicals and ink
- applications: anti-litho roller tubes
- low specific weight

Types of Drive

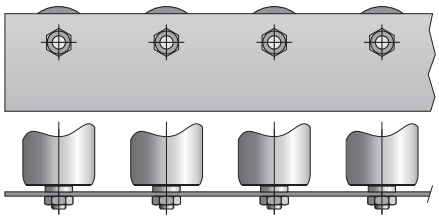
Gravity conveyor rollers
In many cases products need not be conveyed on driven rollers; they can be transported on gravity conveyors. It is very important that conveyor rollers function with the lowest possible friction and least starting resistance.

Driven rollers
Driven rollers are used in many applications and are available in many different designs. The drive can be chain or toothed belts, or with frictional drive using round or flat belts. Positive drive rollers allow no slip between the roller and drive and are subject to sudden "start and stop." The use of chain frequently creates noise, which can be considerably reduced when using a polyamid drive material instead of steel. Sprockets made of steel or plastic are both very strong. The weakest component of the drive arrangement is the chain. The chain's breaking load determines the maximum possible driving length of the conveyor.

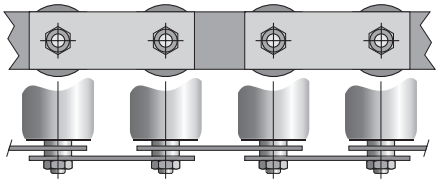
The use of frictionally engaged "slip" drives adds additional load on the rollers due to the pressure necessary to produce torque. For that reason friction drives are normally used only for the handling of light and medium weight goods.

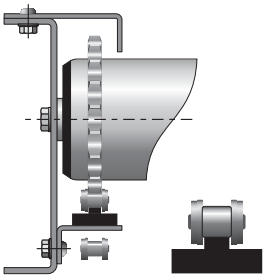
Positive drives
Interroll uses three types of positive drives:
- tangential drive roller by chain
- roller to roller drive by chain

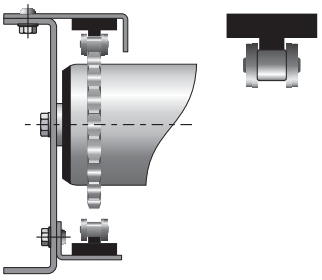
Tangential drive

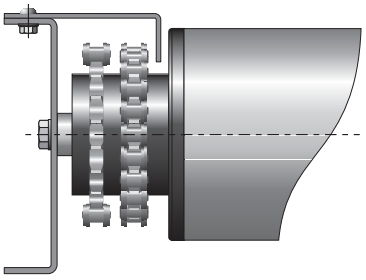


Roller to roller drive









Tangential drive
The tangential chain drive is efficient and easy to build. The length of chain is shorter than for roller to roller drive. This single chain powers all the rollers of one section. The chain engages the corresponding sprocket wheels, and is supported by a chain guiding profile made of low friction plastic, transferring the necessary driving force to a single roller sprocket tooth. The driving chain can be positioned to drive over or under the roller sprockets. The drive station must be installed to maintain the tension in the chain as tight as possible and is often equipped with a device for automatic adjustment of chain tension. Tension rollers at the drive station need to withstand normal conveyor loads plus extra vector forces. These forces should be considered carefully during roller selection. The length of conveyor, powered by a single drive unit, is determined by the breaking load of the chain, and by the weight of the load to be conveyed. In comparison to roller to roller conveyor, the tangential drive is easy to assemble.

Roller to roller drive
Assembly is relatively easy, but a certain number of restrictions must be considered when using this drive design. Chain guidance is not necessary, but roller spacing (distance from roller to roller) must be held to strict tolerances.

The maximum length of a conveyor powered with a single drive unit is calculated by the breaking load of the chain. The chain has to withstand the highest load at the drive. The drive unit should always be located in the middle of the conveyor, in order to optimize the tensile strength of the chain. Verify the load capacity of the rollers installed near the drive unit since those rollers function as pressure rollers.

Roller pitch
The possible roller pitch “t” for roller to roller drive is a multiple of the half chain pitch “p” of the corresponding chain, thus:

t = K p/2 [inch]
K = whole number
t min. = Max Sprocket Dia.

The total number of the chain links is given by the sum of the number of teeth “Z” of the sprocket and “K”; it should be an even number, otherwise an offset connecting link must be used. Interroll recommends the following tolerances for roller pitch “t”:

Chain pitch (#)	P (inch)	Tolerance for “t” (inch)	Breaking load (lbs)
35	.375	+0 /-.015	2,100
40	.500	+0 /-.025	3,700
50	.625	+0 /-.030	6,100
60	.750	+0 /-.032	8,500
80	1.00	+0 /-.039	14,500

Light Duty Conveyor Rollers Series 1100

(plastic bearings with stainless steel balls)

Bearing

Balls: Stainless steel

The bearings used are molded of either polypropylene or acetal plastic, according to size. They are provided with double labyrinth seals to prevent entry of dust, dirt and other contaminants. Balls are corrosion resistant type 302 stainless steel. Bearings may be washed or steam cleaned without damage and are suitable for operation in temperatures up to 150°F.

Due to the limited heat dissipation capacity of plastic ball bearings, Series 1100 rollers should not be used for high speed powered applications.

Tube

Diameters (inch).62, .75 (.78), 1.12 (1.18), 1.90.

A wide selection of tube material is available for this series. Selection is dependent upon application but where loads are light, PVC is recommended for maximum economy.

Shaft

Diameter: .192 .250 .312
Hexagonal: .312 .375 .437

Shaft materials include carbon steel, aluminum and stainless steel in a variety of sizes and mounting types.

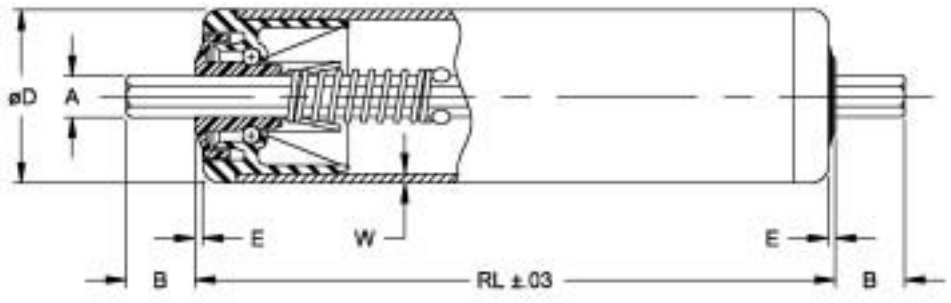
Application

These rollers are lightweight and free-rolling with a clean and attractive finish. The unique plastic design is virtually corrosion proof.
These rollers have wide application in light duty gravity conveyors, flow racks and machinery of all types.

Applications include fisheries, canneries, meat packing plants and commercial food equipment including dishwashing machinery and food-handling conveyors.

Ideal for interfacing with all types of packaging machinery.

Light Duty
Conveyor Rollers
Series 1100



(Typical RL=BF–.12)

Note: For Hex shafts, "A" dimension indicates flat-to-flat measurement.

Metal Conveyor Rollers Series 1200
(commercial bearings)

Bearing
Balls: Steel
All rollers in this series are fitted with commercial grade steel ball bearings which are zinc-plated for mild corrosion resistance. Bearing races are burnished or coined, and then hardened, to provide smooth, low-torque operation.

Balls are made from bearing quality steel and are fully hardened and ground. Close fit between mating parts provides limited protection against entry of dust and dirt.

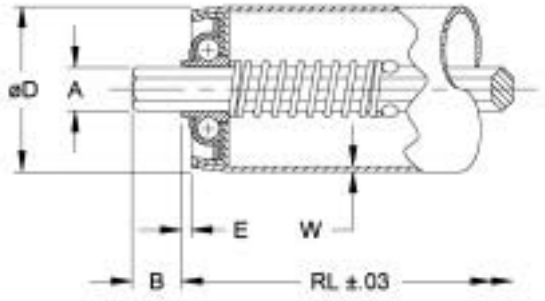
Tube
Diameters (inch) .75, 1.00, 1.38, 1.90, 2.50, 3.15.
Series 1200 rollers are supplied with metal tubes only. Steel tubing is low-carbon steel, AISI 1010-1015, electrically welded. Many of these rollers can also be supplied with stainless steel or aluminum tubes on special order.
Check with factory for availability.

Shaft
Diameter: .250
Hexagonal: .312, .437 and .687
Standard shaft metal is unplated, low-carbon steel.

Application
Series 1200 rollers are widely used in gravity and powered conveyors, packaging machinery, storage systems and cargo handling equipment.

These rollers have been designed to provide maximum value in terms of load capacity versus cost.

Metal Conveyor Rollers Series 1200



Note: For Hex shafts, "A" dimension indicates flat-to-flat measurement.

* Heavy Wall Tube - See Tubes C66 and G66

Heavy Duty Conveyor Roller Series 1450

Bearings
Balls: Precision ground chrome alloy steel. 6205ZZ precision bearings.
Conforming to ABEC-1 industry standards, they provide virtually infinite life in almost every conveyor application.

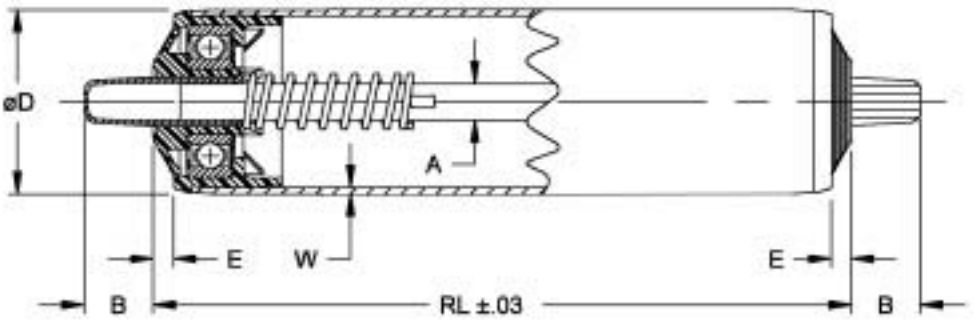
The bearing housings are made of either black polyamide 6 (Nylon) with a yellow polyamide shield, or conductive molded polypropylene with a polyamide shield. The sealing arrangement protects the ball bearings against coarse dust. Additionally, the use of technopolymer parts insures low noise operation.

Tube
Diameters (inch) 2.50" & 3.50"
The housing is swaged and locked in place in the roller tube. Smooth, radiused roller ends facilitate easy transfer of conveyed good, eliminating any possibility of snagging or scraping sensitive surfaces. The steel tubes have a wall thickness of .120" (11 gauge) and are supplied in either galvanized or mill finish.

Shaft
Diameter: .787" (20mm)
Hexagonal: .687" straight hex & .687" patented Taperhex
Shafts can be supplied with the sizes listed above and can be spring loaded or end drilled and tapped.

Application
This roller is suitable for conveying heavy items, particularly pallets and containers. The load capacity can be up to 1,124 lbs. (depending on conveyor width and speed).

Heavy Duty Conveyor Roller Series 1450



Note: For Hex shafts, “A” dimension indicates flat-to-flat measurement.

Journal Bearing Conveyor Rollers Series 1500

Bearings

Journal

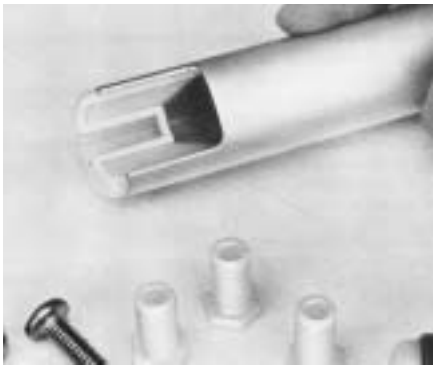
Series 1500 rollers have been designed to operate without lubrication. However it is true with all journal bearing materials operating without lubrication, some wear will be experienced over long periods of time.

To insure the highest level of performance and maximum life, initial lubrication is recommended. A few drops of oil applied at installation assists seating and allows a good wear resistant bearing-to-shaft match to form. Initial lubrication can increase the life of the bearings up to ten times their unlubricated lifetime.

Tube

Diameters (inch) 1.12 (1.18), 1.90, 2.50, ***3.50***

A wide selection of tube material is available for this series. Selection is dependent upon application but where loads are light, PVC is recommended for maximum economy.



Shaft

Stub shaft

The design is based on the use of molded nylon stub shafts which are bolted to the conveyor frame and which act as cantilevered shafts. The end bearings of the roller engage the stub shafts and loads are transmitted through the roller to the stub shafts and frame. Molded of acetal plastic, the end bearings are unusually quiet in operation. Acetal bearings running on nylon stub shafts have a very low coefficient of friction, with excellent operating life.

Application

Typical applications include gravity conveyors in meat and dairy processing plants, and rollers for dish and tray conveyors in commercial kitchens.

Universal Conveyor Rollers Series 1700

(commercial, stainless steel and precision bearings available)

Bearing

Balls: Commercial, Precision (6002) or Stainless Steel

All three styles of bearings are protected against the entry of dust and dirt by a special labyrinth seal design; the molded seal being configured to eject water in areas where moisture is a consideration.

Where speeds are low and cost considerations are paramount, use of commercial grade bearings is recommended. For higher speed applications where both noise and longevity are important parameters, precision bearings are the right choice. Although load carrying capacities are reduced when compared to other types, stainless steel bearings provide an extra measure of protection against corrosion and are frequently specified in food handling and washdown applications.

Tube

Diameters (inch). 1.38, 1.90, ***50mm***, 2.50, ***3.15***, ***3.50***

This series makes use of a resilient shock absorbing plastic housing which is swaged and locked in place in the roller tube. Smooth, radiused roller ends facilitate easy transfer of conveyed goods, eliminating any possibility of snagging or scraping sensitive surfaces.

Some sizes are also available with stainless steel, PVC, polyethylene and aluminum tubes. Please check factory for availability.

Shaft

Diameter: .500", ***12mm, 17mm***
Hexagonal: .437"

Shaft materials include carbon steel and stainless steel in a variety of sizes and mounting types.

Application

This is the universal roller for virtually every conveying application. Several alternate bearing designs are available providing users with a wide choice of load and speed capabilities. This versatile arrangement assures maximum cost effectiveness while providing unlimited design flexibility. Typical applications include gravity and powered conveyors.

Precision Rollers Series 1800
(precision bearings)

Bearing
Balls: Precision ground chrome alloy steel

Accuracy begins with the shielded deep-groove, chrome alloy, precision-ground ball bearings (ABEC-1). Cleanliness is insured by an external “dirtguard” with polyester felt contact seals which protects against contaminants. Axial play is eliminated by the use of bowed retaining rings on both ends of the shaft. Bearings are housed in a sintered iron housing produced to extremely “tight” tolerances for concentricity and fit.

Tube
Diameters (inch) ***2.00***, 2.50, ***3.00***, 3.50

Tubes are precision end-bored to assure proper housing fit and minimal runout.

Shaft
Diameter: ***.669***, .787, .984

Hexagonal: .437, .687

Two shafts are available; hex shafts are spring-loaded for typical mounting and for more precise applications, round shafts may be preferred. Round shafts are cold drawn steel with bearing seats precision-ground for accurate fit. Shaft ends can be milled, cross-drilled, tapped or threaded.

Application
Precise in every detail, these rollers are designed for heavy-duty applications requiring high load capacity and long life. These are well suited for high-speed powered installations where low noise levels are required. Typical applications include parts handling equipment, guided vehicles (AGV’s), transfer machines, high speed packaging lines and belt conveyors.

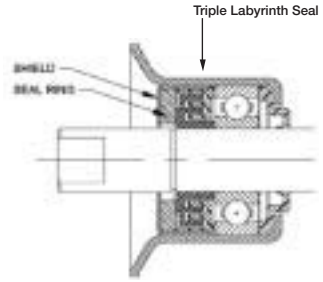
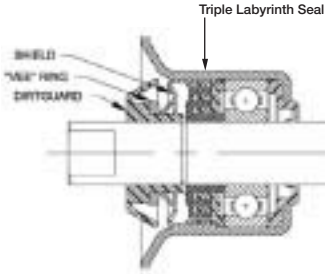
Heavy Duty Welded Conveyor Rollers Series 1940 Series 1960

(precision bearings)



Series 1.940 seal design



Series 1.960 seal design

Bearing

Balls: Precision ground chrome alloy steel

Series 1940 bearings are protected from contaminants by a series of elements as shown on left.

Series 1960 bearings utilize an additional dirtguard shield and seal. The shield, made of diecast zinc alloy, deflects large dirt particles from the bearing area. Smaller particles and liquids which work their way between the stationary dirtguard and the rotating steel shield are automatically ejected as the roller turns. The rubber "vee" ring maintains 360° contact with the steel shield, preventing loss of grease at the same time excluding dirt and water. A triple labyrinth seal and a seal provide an extra measure of protection for the bearings.

Tube

Diameters (inch) 2.50, 3.50, 4.00, ***5.00***

Designed for heavy-duty conveying applications, Series 1940 and 1960 rollers feature UNIBLOC welded end construction. Heavy gauge steel ends are permanently welded in place with weld seams continuous over a full 360°. Rollers are fitted with high quality precision ground ball bearings which are factory lubricated with SHELL ALVANIA EP2 grease.

Shaft

Diameter: .787

Available with milled flats, end drill and tap or threaded.

Application

Suitable for heavy duty palletizer applications as well as exposure to environmental elements such as bulk handling conveyors and foundry operations.

Sprocket Driven Rollers with Welded Construction Series 3400
(precision bearings)
Series 3500
(commercial bearings)

Bearing

Series 3500 Commercial

Commercial grade steel ball bearings which are zinc plated for mild corrosion resistance.

Series 3400 Precision

Precision ground chrome alloy steel ball bearings 6203ZZ and 6205ZZ.

Tube

Diameters (inch).1.90, 2.50

Steel roller tube for 1.90" diameter is 16 gauge (.065) supplied in mill finish. Steel roller tube for 2.50" diameter is 11 gauge (.120) supplied in mill finish.

Shaft

Hexagonal: .437, .687

Standard shaft material is unplated low-carbon steel. For mounting convenience both .437 and .687 hex shafts can be supplied either spring-loaded for snap-in assembly, or with tapped ends for bolted construction.

Sprockets

1.90" diameter:

15 teeth - #50 chain
18 teeth - #40 Chain

2.50" diameter:

15 teeth - #60 chain
18 teeth - #50 chain

Application

Series 3400 and 3500 drive rollers provide a simple and economical means for building powered roller conveyors.

These drive rollers are available with either single or double sprockets. Sprockets are MIG welded with 360˚ continuous weld.

The double sprocket design is particularly well suited for heavy duty applications where short lengths of chain connect each roller to the next.

Single sprocket rollers, driven by a continuous chain that engages the sprocket teeth tangentially, are better suited for light duty applications.

Drive Rollers with Slip Drive or Direct Drive Series 3800

Bearing
Balls: Commercial grade

Tube
Diameters (inch) 1.90, 2.50.
Aluminum, stainless steel and galvanized steel tubes are available in the 1.90" diameter drive rollers, only galvanized steel is available in the 2.50" diameter.

Shaft
Diameter: .500

Application
The Series 3800 has been designed to provide a simple and economical means of building powered conveyor systems with accumulation capability. Loads can be stopped and released at any point without stopping the chain drive. The slip drive relies on friction between two coaxial members. The inner member rotates continuously as it is chain driven. The outer member, the conveyor roller, is in sliding contact with the inner member through a bushing. Transmitted torque between the inner and outer member is proportional to both load and speed.

This series is recommended for speeds up to 60 fpm where continuous slippage is a requirement. For intermittent slippage applications speeds up to 90 fpm are possible.

For applications where accumulation is not required Series 3800 rollers may also be supplied for direct drive. This is accomplished using mating keys and keyways in the contact area of the inner roller and outer members. For both direct and slip drive, these rollers are available with single and double sprockets. Single sprockets are used with tangential chain drive, double sprockets are used where chains connect one roller to the next.

Tapered Conveyor Rollers

Series 1300
(commercial bearings)

Series 1350
(stainless steel bearings)

Series 1400
(precision bearings)

Bearing
Balls: Commercial, Precision or Stainless Steel

This innovative series of tapered rollers offers the designer a choice of three distinct bearing systems for building roller curves. Tapered rollers with commercial grade ball bearings, stainless steel ball bearings or chrome alloy steel precision bearings are all available. Bearings are fitted into nylon housings. Double labyrinth seals, snapped into place, complete and assembled providing a pre-lubricated bearing cartridge which is fully protected from dust and dirt and requires no maintenance.

Tube
Diameters (inch) 2.07 (small end)

Steel roller tubes (or optional aluminum or stainless tubes) are overlaid with several high impact molded polypropylene conical segments to form a continuous tapered roller assembly to desired length. The completed assembly offers excellent wear properties, noise dampening and shock resistance. For powered applications, the smaller end of the tube can be friction driven by polyurethane “O” rings.

Shaft
Diameter: .500,
Hexagonal: .437

Shafts may be spring-loaded, tapped or threaded.

Application
45°, 90° and 180° conveyor curves with a 32" inside radius.

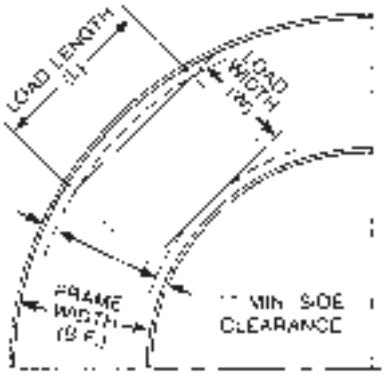
Note: For grooved tube part numbers, please contact the factory for further information. For Hex shafts, “A” dimension indicates flat-to-flat measurement.

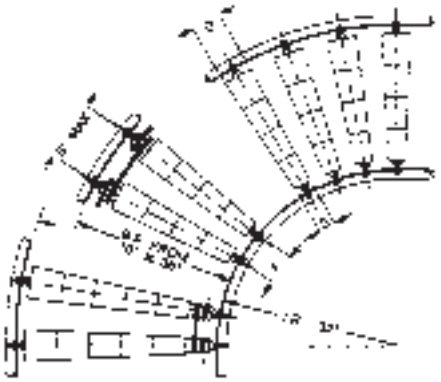
To order, use the following reference to form your ten-digit part number:

1.318.T14.C42-14.88"RL

Bearing Part No.
Tube Part No.
Shaft Part No.
15" between frame

Tapered Conveyor Rollers Series 1300, 1350, 1400





Curved design
Interroll plastic tapered rollers increase in diameter by 0.062" each inch of many lengths. Rollers may be ordered in many roller lengths from 9.88" to 35.88" for a range of 10" to 36" between conveyor frames.

The small (S) and large (D) diameters of the rollers are dependent upon the roller length. The small diameter is typically 2.07". The large diameter is wholly dependent upon the small diameter (S), the roller length (RL) and the roller taper.

The required number of rollers per 90° curve is dependent upon the inside frame pitch (P) of the rollers. It should be close enough for a minimum of three rollers to be supporting the load at any point in its travel.

For loads outside the range of the chart, the following formula may be used:

$$BF = \sqrt{[(32" + 1" + 18")2 + (24"/2)2]} + 1" - 32"$$

Example:

Load width (W) = 18"
Load length (L) = 24"
Chart shows (BF) = 22"
Inside Radius of curve (R)=32"

For the same sample, the formula would give ...

$$BF = \sqrt{[(32" + 1" + 18")2 + (24"/2)2]} + 1" - 32"$$

Answer 21.39" or 22"

On conveyor curves using Interroll tapered rollers, the between frame (B.F.) width for various size loads may be calculated as follows:

(a) Determine the length (L) and the width (W) of the largest load.
(b) Select the B.F. width from the B.F. selection chart given below.
(c) If the load is outside of the chart's range, or the inside radius (I.R.) of the curve is other than 32", use the formula given to the side of the chart.

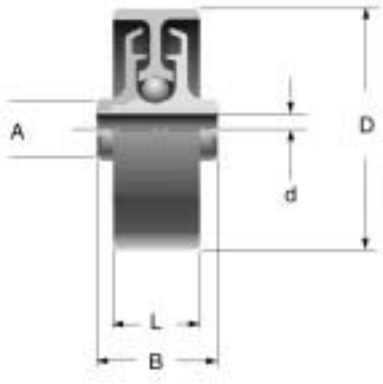
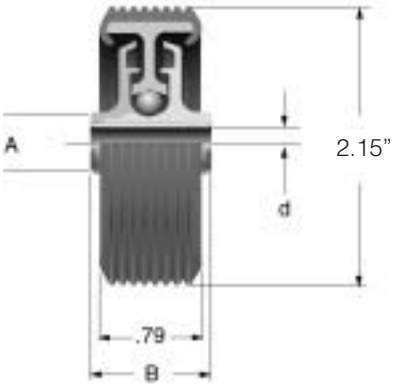
5 OTHER COMPONENTS





Plastic Conveyor Wheels Series 2160

Wheel
Diameters (inch) 1.90.

A totally new concept in conveyor wheel design, Series 2160 wheels are molded of high impact strength polypropylene... a versatile plastic which is both light weight and corrosion resistant.

These shock absorbing wheels are elastic to a degree and impact loads are absorbed by the wheel rather than transmitted through it which is important in transporting fragile items such as glassware, delicate instruments.

Bearing
Balls: Carbon or stainless steel

Load capacity (in lbs.)
Up to 15 lbs. per wheel

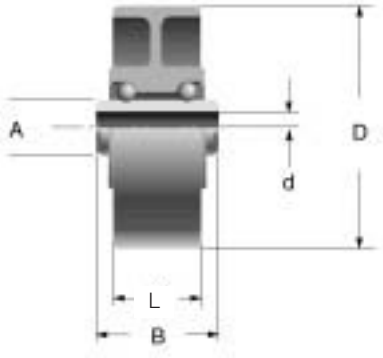
Application
These easy rolling wheels are well suited for transporting light goods, such as lightbulbs, cereals and empty cardboard boxes. They have widespread application in gravity conveyors, flow-racks, casters and other material handling equipment.

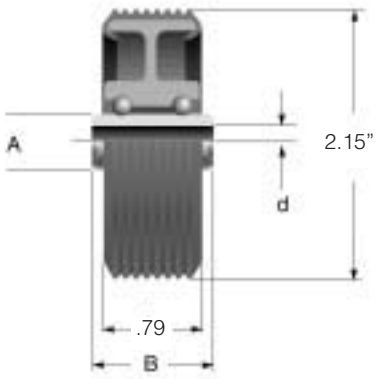
Since they are half the weight of comparable aluminum wheels these wheels are ideal for portable conveyors used on trucks and in busy loading areas. Manufacturers’ shipping charges can also be substantially reduced.

Note: Snap-on rubber tires are available for Series 2160 conveyor wheels (see drawings above). They are generally used to provide silent operation, to eliminate skidding or to protect fragile items. Order separately as part number 2100.

Wheels

Part Number	D	d	A	B	L	Finish	Balls
2162	1.90	.25	.48	.81	.67	Blue	Carbon Steel
2163	1.90	.25	.48	.81	.67	Gray	Stainless Steel
2166	1.90	.31	.48	.81	.67	Blue	Carbon Steel
2167	1.90	.31	.48	.81	.67	Gray	Stainless Steel





Plastic Conveyor Wheels Series 2190

Wheel

Diameters (inch) 1.90.

Series 2190 wheels are molded of acetal and Nylon materials.
Wheels are protected from contamination with integral shields.

If wheels are to be mounted using bolted construction, we recommend the use of either 2190 or 2191 wheels. Both are bushed to a .25 inch inside diameter using zinc-plated carbon steel reducer bushings. The bushing acts as a spacer tube and eliminates any chance of binding the wheel as a result of over tightening. The bushings are supplied loose and are simple to install at final assembly.

Bearing

Balls: Carbon or stainless steel

The double row ball bearing construction provides higher load carrying capacity than our Series 2160 as well as high impact strength.

Load capacity (in lbs)

Up to 25 lbs. per wheel

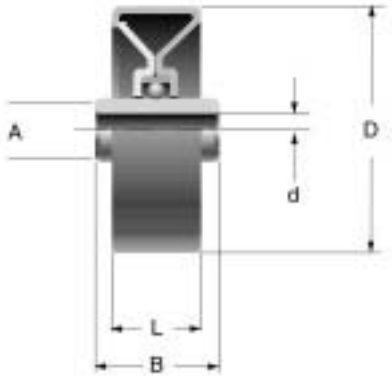
Application

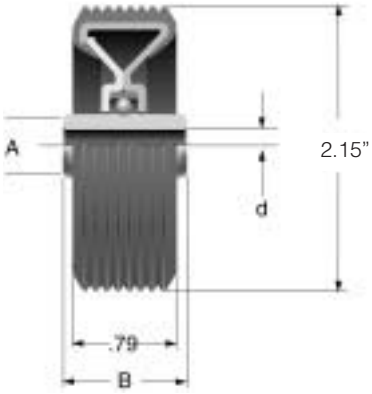
These wheels may be used as a direct replacement for conventional steel or aluminum wheels in many applications. They provide all the desirable properties of plastic wheels; quiet operation, non-marking, corrosion resistance, etc., while maintaining high load capacity.

Note: Snap-on rubber tires are available for Series 2190 conveyor wheels (see drawings above). They are generally used to provide silent operation, to eliminate skidding or to protect fragile items. Order separately as part number 2100.

Wheels

Part Number	D	d	A	B	L	Finish	Balls
2190	1.90	.25	.59	.94	.63	Wh/Blk	Carbon Steel
2191	1.90	.25	.59	.94	.63	White	Stainless Steel
2192	1.90	.31	.59	.94	.63	Wh/Blk	Carbon Steel
2193	1.90	.31	.59	.94	.63	White	Stainless Steel





Steel Conveyor Wheels Series 2200

Wheel
Diameters (inch) 1.94, 2.50

Series 2200 wheels feature rugged all metal construction. Both inner and outer raceways are fully heat-treated for long trouble-free life. All external parts are zinc-plated for good appearance and mild corrosion resistance.

Bearing
Balls: Carbon steel

Load capacity (in lbs.)
See table below

Applications
All Series 2200 wheels find wide application in wheel conveyors and live storage systems where their free rolling characteristics provide exceptional performance. They are also suitable for use as guide wheels around curves and along straight sections.

Note: Snap-on rubber tires are available for Series 2200 conveyor wheels (see drawings above). They are generally used to provide silent operation, to eliminate skidding or to protect fragile items. Order separately as part number 2100.

Wheels

Part Number	D	d	A	B	L	Material	Capacity

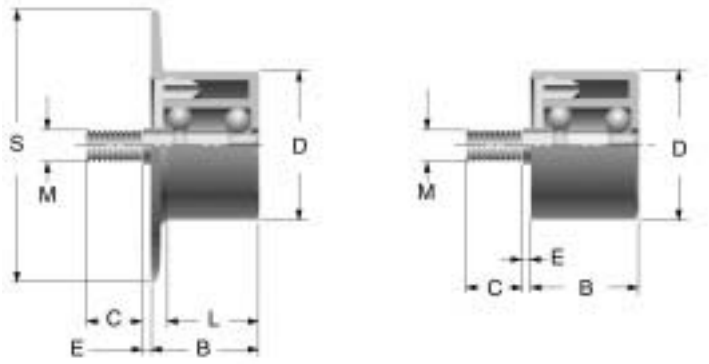
2263*	1.94	.25	.48	.81	.67	Steel	75 lbs.

* Rubber tire available



Flanged Conveyor Wheels Series 2300

Wheel
Diameters (inch) 1.50
These wheels have low inertia and start rolling easily. An incline as low as 1 percent is all that is needed for free movement.

The polypropylene plastic outer race for most applications can be considered as chemically inert. Polypropylene resists attack by most acids, alkalies and other chemicals. The glasslike rolling surface resists pick-up of foreign material.

Close fit-up between parts prevents entry of dirt and grime into the bearing area. Lubrication is never required.

Bearing
Balls: Carbon or stainless steel
The Series 2300 flanged conveyor wheels are equipped with double row ball bearings for maximum load capacity ... a total of sixteen 3/16" diameter balls is used in each unit. The steel inner race is accurately machined and is zinc plated.

Load capacity (in lbs)
Up to 25 lbs. per wheel

Application
Series 2300 flanged conveyor wheels are designed for use in flow racks (first-in first-out storage systems) and other material handling applications where side guidance is required (see drawings above). They provide true ball-bearing performance at minimum cost.

A companion series of wheels without flanges is also available for use where side guidance is not required and the internal construction is identical to the flanged units.

Plastic Omni Wheels for Multi-Directional Movement Series 2500

Construction

Diameters (inch) 1.90" and 3.15".

The unique Omni wheel design is based upon the use of a series of free turning barrel-shaped rollers which are mounted in a staggered pattern around the periphery of a larger diameter main wheel. The combination of these two rolling elements provides a compact and inexpensive unit for moving heavy loads in any direction along a plane; doing so smoothly and with a minimum effort. Unlike competitive transfer devices (ball transfers, swivel casters, etc.).

Mounting

Mounting of Omni wheel units is both simple and direct. They may be fitted with axles or spacer bushings and installed in "U" shaped steel or aluminum channels. Alternately, they may be mounted on shafts and installed on conveyors in place of wheels or rollers, providing a convenient transfer station without the expense of designing and building transfer tables.

Omni wheels with hexagonal bores make building powered transfer systems a simple task. By simply mounting the Omni wheels on mating hexagonal shafts which are powered, single or double (X-Y) axis movement may be obtained.

Load Capacity (in lbs.)

25 - 75 lbs per set

Application

Omni wheels are corrosion resistant and well suited for applications where dirt, dust and moisture may be present. They require no lubrication or field maintenance.

Ordering Note:
At least two Omni wheels must be used together to provide support over 360° of rotation. Please order accordingly.

Omni wheel	Part No.	Shaft	Size	Dia.	A	B	C	Capacity	Remarks

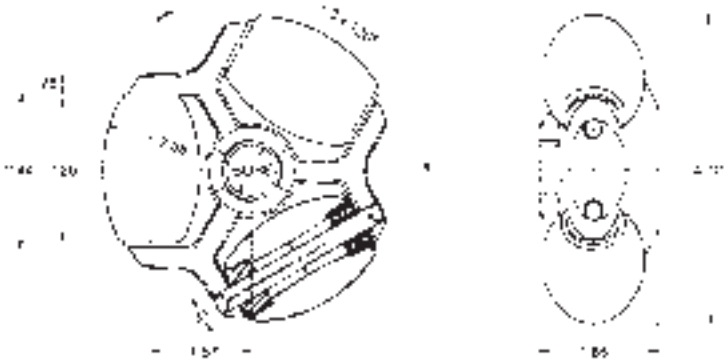
	2581	.437"	hex	3.15"	.16	1.34	1.18	75 lbs.	For powered applications

*Note: Bushing part number for .25" shaft is N001



Heavy duty Omni Wheels for Manual and Powered Transfer Systems Series 2530

Construction
Diameters (inch) 4.72"

Series 2530 Omni wheel barrels are made of die cast aluminum for manual systems; with polyurethane barrels also available for powered applications (to prevent slippage). Barrels and frame are fitted with zinc-plated ball bearings.

Mounting
Series 2530 Omni wheels feature die cast aluminum frame with built in keys for coupling multiple units. This arrangement provides maximum mounting flexibility to suit almost any transfer requirement.

Load capacity (in lbs.)
220 lbs. per pair

Application
Series 2530 Omni wheels are well suited for use in heavy-duty manual or powered transfer systems.

Ordering Note:
At least two Omni wheels must be used together to provide support over 360° of rotation. Please order accordingly.

Heavy Duty Omni Wheels for Manual & Powered Transfer Systems Series 2530

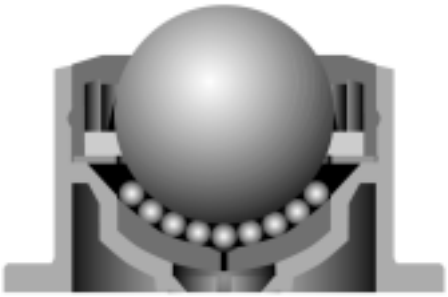
2538	.875 hex	Polyurethane	Ball bearing	None

Non-standard Omni Wheel order item – average lead time is 12 weeks.



Medium duty ball transfers Series 5500

Construction

Interroll ball transfers allow objects to be moved in any horizontal direction with minimum effort. They are well suited for transfer applications on conveyor lines, production machinery, packaging equipment and in air cargo handling. A variety of mounting styles offers the user maximum flexibility in building transfer equipment. The housing of the Interroll ball transfers are made with plastic materials and the spherical ball cup is hardened. Steel and stainless bearing elements are protected against contamination by a felt seal which is fitted around the main ball to wipe away dust and grime.

Under dynamic conditions, these support balls continually recirculate providing constant support for the applied load. For unusual application requirements, Interroll ball transfers may be supplied with plastic main balls for non-marking, or stainless steel main and support balls for outdoor use.

All load capacity information has been based on absolutely flat, horizontal and surface hardened platforms of conveyed goods.

Mounting

- Flange mount
- Inverted flange mount
- Top flange mount
- Stud mount
