Printed in Japan

Windows and Windows XP are registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.

- The information is subject to change without notice.
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of TESSERA TECHNOLOGY INC.. TESSERA TECHNOLOGY INC. assumes no responsibility for any errors that may appear in this document.
- TESSERA TECHNOLOGY INC. does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of TESSERA TECHNOLOGY INC. products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of TESSERA TECHNOLOGY INC. or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. TESSERA TECHNOLOGY INC. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

CAUTION

- Do not give any physical damage to this equipment such as dropping
- Do not superimpose voltage to this equipment.
- Do not use this equipment with the temperature below 0°C or over 40°C.
- Make sure the USB cables are properly connected.
- Do not bend or stretch the USB cables.
- Keep this equipment away from water.
- Take extra care to electric shock.
- This equipment should be handled like a CMOS semiconductor device. The user must take all precautions to avoid build-up of static electricity while working with this equipment.
- All test and measurement tool including the workbench must be grounded.
- The user/operator must be grounded using the wrist strap.
- The connectors and/or device pins should not be touched with bare hands.

Introduction

TK-78K0R/KE3L+USB is the evaluation kit for development with sound systems using "78K0R/KE3-L", NEC Electronics 16bit all flash microcontroller.

The user only needs to install the development tools and USB driver, and connect the host machine with the target board to start the code development, build, monitoring the output, and debugging code.

(This demonstration kit uses the on-chip debug feature from the microcontroller itself, without emulator connection)

Configuration for Debugging

Overview	This manual consists of the following contents. Read chapter 1 and 2 first for installing the development tools and using the sample programs. Read chapter 3-5 for customizing the sample programs and the hardware.
Chapter 1:	Preparations Install the development tools
Chapter 2:	Experiences Experience the basic operations of integrated development environment (PM+) and integrated debugger (ID78K0R-QB) with using sample programs.
Chapter 3:	Hardware Specifications Explain the hardware of TK-78K0R/KE3L+USB
Chapter 4:	Troubleshooting Describe how to solve troubles you may face, such as errors when starting the integrated debugger (ID78K0R-QB)
Chapter 5:	Other Information Introduce other information, such as how to create a new workspace (project) on integrated development environment (PM+), how to register additional source file, and some useful tips of the integrated debugger. The circuit diagrams of demonstration kit are included in this chapter.
Reader	This manual is intended for development engineers who wish to become familiar with the development tools for the 78K0R. It is assumed that the readers have been familiar with basics of microcontrollers, C and Assembler languages, and the Windows™ operating system.
Purpose	This manual is intended to give users an understanding of the features, hardware configurations, development tools for the 78K0R.

CHAPTER 1 Preparation

This chapter describes following topics:

- Overview and installation of development tools
- Installation of development tools
- Overview and preparation of sample programs

Users can experience the development flow such as coding, build, debugging, and test, by using the development tools bundled with TK-78K0R/KE3L+USB.

1.1 Development Tools / Software

- Device file DF781026 V1.00

A device file contains device specific information. So, users need a device file to use the development tools.

- Integrated Development Environment (IDE) PM+ V6.31

The IDE works on Windows operation system.

Users can develop a system efficiently by using the editor with idea processor function, compiler, and debugger.

- C Compiler CC78K0R W2.12 (code size limited version)

C compiler for the 78K0R microcontrollers. The object code size is limited to 64 Kbyte.

This compiles C code for 78K0R and ANSI-C code program into assembler code.

This produces object code and linker.

- Assembler RA78K0R W1.33 (code size limited version)

Assembler for the 78K0R microcontrollers. The object code size is limited to 64 Kbyte.

This convert the assembler code for 78K0R into object program. The object program will be used for debugger.

- 78K0R Integrated Debugger ID78K0R-QB V3.60

This is the tool for debugging the object program generated by C compiler and assembler. The debugger enables to do C source level debugging. With the debugger, you can debug the code easily and efficiently by referring and changing variables, using step-in debugging function, and so on.

- Starter Kit USB Driver

This is a software driver for PC to access to the USB interface of the kit.

- HID Class Sample Program / USB Human Interface Device Class Sample Driver

The 78K0R/KE3-L is detected as the HID device.

This sample program behaves as a keyboard. And it is used in [chapter 2].

Please refer to the "USB HID (Human Interface Device) Class Driver application note" for further details.

- CDC Class Sample Program / USB Communication Device Class Sample Driver

The 78K0R/KE3-L is detected as the CDC device.

This sample program behaves as a COM port.

Please refer to the "USB CDC (Communication Device Class) Driver application note" for further details.

1.2 Installation of Development Tools

1.2.1 Installation Package

The attached CD-ROM includes the development tools and documentations. Users can use the installer to install those development tools and documentations.

1.2.2 Installation of Development Tools

- ① Please insert the CD-ROM in the drive. The installer will show up automatically.
If it does not start automatically, please initiate it by double clicking the SETUP.EXE.

<1> Readme First

The contents of the CD-ROM, and some notes are available.
Please read it at first.

<2> Install...

Click "Install" to start installation of development tools.
For details, please refer to the next section.

<3> Documents

Manuals of development tools and the evaluation kit are available in PDF files.

When this button is clicked, the WWW browser will start. Adobe® Acrobat® Reader is available in the CD-ROM.

<4> Sample Program

Click this button to start the WWW browser for the sample program and the tutorial.

<5> Link to NEC Electronics Microcontrollers

Click this button to start the WWW browser display the link to the NEC Electronics Microcontroller web site (http://www.necel.com/micro/index_e.html)

The NEC Electronics Microcontroller web page provides with the latest product/tool information and FAQs.

<6> Exit

Terminate the setup.

② Click the "Install"

③ "Tool Installer" dialog box is opened.

Select products that you need to install.

(as default, all the products that you need to use the TK-78K0R/KE3L+USB are selected.)

"Explain" area displays an explanation of the selected product.

To change the installation destination, click **Browse...** .

When all the settings are completed, click **Install...** .

* In this document, it is assumed that users install the programs under "NEC Electronics Tools" directory (default installation directory). Users can find the tools by selecting "Start Menu" -> "Programs" -> "NEC Electronics Tools".

④ Click **OK** when "Install" confirmation dialog box is opened.

- ⑤ Read "software license agreement" and click **Yes** for continuing the installation.
To stop the installation, click **No**.

- ⑥ Enter the product ID, and click **Next**.
- * The product ID is available on the other sheet.

- ⑦ It starts copying the files.

- ⑧ Click **Next** when "Select Files" installation wizard dialog opened.

- ⑨ When the installation is completed, the following dialog opens.
Click **OK** .

- ⑩ "NEC Electronics Starter Kit Virtual UART" USB driver must be installed on PC before you connect to TK-78K0R/KE3L+USB.

Install the USB driver by referring "1.3 Installation of USB Driver".

Notes on the installation authority

To install this tool in Windows 2000 or XP, the authority of an administrator is necessary. Therefore, please login as an administrator.

Notes on the install-directory

Please do not use 2-byte characters, such as umlaut in the directory name, where the product is to be installed.

Note on the version of Windows

If the language of the Windows is not English, a file transfer error during installation might be observed. In this case, please abort the installation in the language, and re-install it in an English version of Windows.

The identical problem may be observed, if a language other than English is specified as the system language in the "Regional Settings Properties" tab.

Limitation

Assembler RA78K0R and C compiler CC78K0R limit the object size to 64 Kbyte.

1.3 Installation of USB Driver

"NEC Electronics Starter Kit Virtual UART" USB driver must be installed on PC before you start using the TK-78K0R/KE3L+USB.

Please, follow the instruction below to install the driver.

"Starter Kit USB Driver" must be installed on the PC. If not, please refer to "1.2 Installation of Development Tools" to install the driver first.

CAUTION:

Do not use a USB hub for connecting TK-78K0R/KE3L+USB.

First, connect the TK-78K0R/KE3L+USB USB2 to PC with USB cable.

Depending on the version of Windows OS, the installation will be differed. Please check your Windows version, and follow the instructions

- Windows XP -> "1.3.1 Installation on Windows XP"
- Windows 2000 -> "1.3.2 Installation on Windows 2000"

After the installation, go to "1.3.3 Completion of USB Driver Installation"

1.3.1 Installation on Windows XP

1. Once the TK-78K0R/KE3L+USB is connected with USB, the "Found New Hardware Wizard" will be started.

Select "No, not this time" and click **Next >** .

2. Select "Install from a list or specific location" and click **Next >** .

3. Select "Search for the best driver in these locations.", check "Include this location in the search:", and then click "Browse..." to select the driver directory path. The path should be "C:\Program Files\NEC Electronics Tools\TK-driver" as default installation. If the installation directory is not default, then select "TK-driver" under the installation directory.
Click **Next >** .

4. If the following dialog is opened, click **Continue Anyway** .

6. The installation of "NEC Electronics Starter Kit Virtual UART" driver is completed. Click **Finish** .

7. Go to "1.3.3 Completion of USB Driver Installation".

1.3.2 Installation on Windows 2000

1. Once the TK-78K0R/KE3L+USB is connected with USB, the "Found New Hardware Wizard" will be started.

Select "No, not this time" and click **Next >** .

2. Select "Search for a suitable driver for my device".

Click **Next >** .

3. Select "Specify a location".
Click **Next >**.

4. Select the driver directory path. The path should be "C:\Program Files\NEC Electronics Tools\TK-driver" as default installation.
If the installation directory is not default, then select "TK-driver" under the installation directory.
Click **OK**.

5. Click **Next >** .

6. The installation of "NEC Electronics Starter Kit Virtual UART" driver is completed.
Click **Finish** .

7. Go to "1.3.3 Completion of USB Driver Installation".

1.3.3 Completion of USB Driver Installation

Confirm the USB driver is installed on PC.

Start "Device Manager", and find "NEC Electronics Starter Kit Virtual UART" (without "?" mark) under the "Ports (COM & LPT)".

The screen above shows that the COM port number is "COM8". If ID78K0R-QB is not in use, you can use this port number for connecting TK-78K0R/KE3L+USB.

When you change the USB port connection, the COM port number will be changed as well.

CAUTION

- Do not do "Hardware Modification Scan" when you communicate with the target device.

1.4 Sample Programs

This section explains the overview and preparation of sample programs.
For details about the sample programs, see "4. Sample Programs".

1.4.1 Preparation of Sample Programs

- ① Insert the CD-ROM disk in the CD-ROM drive of your PC. The [NEC Electronics Microprocessor Development Tools Setup] screen automatically appears.(if this screen does not appear automatically, start setup.exe from Explorer. etc.)

- ② Press the Sample Program button to start the WWW browser.

- ③ Click the “HID Class sample program, CDC Class sample program” link , the following download confirmation window appears.

- ④ Click the Save button.

- ⑤ After specifying the download destination folder, click the **Save** button.
- ⑥ The self-extraction sample program set (TK78K0R.exe) is copied to the specified folder.
The folder that the “TK78K0R” folder is made when this file is executed, and the sample program is stored under the folder in addition is made.

1.4.2 Overview of Sample Programs

The sample programs consist of following directories.

CHAPTER 2 Experiences

In this chapter, you will experience how to use the development tools with using the sample programs.

The development tools are :

- Integrated Development Environment (IDE), PM+
- Integrated Debugger, ID78K0R-QB

You will use the programs that you prepared in "1.4 Sample Programs", as the sample programs for TK-78K0R/KE3L+USB.

You will be able to understand how to use the development tools and the concept of project files which you need for producing application programs.

The overall steps are as follows:

2.1 Start PM+

Let's start using the development tools.

First, start the PM+

Select "Windows Start Menu" -> "Program" -> "NEC Electronics Tools" -> "PM+ V6.31".

PM+ starts up

2.2 What is PM+

In PM+, application programs and environment setting are handled as a single project, and series of actions such as program creation using the editor, source management, build, and debugging are managed.

Also, one or more project files is managed together as a workspace.

- | | |
|----------------|---|
| Project window | A window in which project names, source files, and include file are displayed using a tree structure. |
| Output window | A window in which the build execution status is displayed. |

➡ For details regarding menu bars and tool bars, refer to "Help" menu in PM+. "Help" on menu bar, then "PM+ Help"

What is a project?

A project is the unit that is managed by PM+. A project refers to an application system and environment development based on PM+.

PM+ saves project information in a "project file".

What is a project file?

A project file contains project information that includes the source files, device name, tool options for compiling, editor, and debugger information.

The file name format is "xxxxx.prj".

Project files are created in the directory you specifies when you create a new workspace.

What is a project group?

A project group is a group comprised of a number of projects in an application system.

The target device of each project must be the same within a project group.

What is a workspace?

A workspace is the unit used to manage all the projects and project group required for one application system.

A workspace file contains one or more project files.

The file name format is "xxxxx.prw".

2.3 Load Workspace (project)

In this section, you will use the workspace that you created in "1.4 Sample Programs". For creating a new workspace, refer to "Chapter 5 Other Information". The workspace has information about the build environment for the sample programs.

Select "File" on menu bar and "Open Workspace...".

Then, select "K0RUSB_HID.prw" under the directory "TK78K0R¥78K0R_USB_HID ¥NEC_project".

Select "K0RUSB_HID.prw", then click **Open**.

The workspace file "K0RUSB_HID.prw" contains one project called "K0RUSB_HID". You will use this project "K0RUSB_HID".

CAUTION:

Please ignore when you get a prompt saying "files could not be found". This may occurred when the installation directory is not a default.

2.4 Set Linker Options

The linker options have been set by the project file. However, some option settings will be covered in this section because the linker option settings are important for debugging. Following three settings are covered specifically.

- Outputs from debugging
- On-chip debug (Desable/Enable, security ID)
- Watchdog timer

Select "Tools" on menu bar, then "Linker options....".

2.4.1 "Output1" Tab

Select "Output1" tab on "Linker Options" window, and see following settings.

– Load Module File settings

Check "Output Symbol Information".

This enables to do source level debugging (setting break points, monitoring variables in watch window, etc).

Also, you can specify the load module file name.

– On-Chip Debug Option Byte

Check "On-Chip Debug Option Byte". Enter "85" in "Control value". This setting enables the on-chip debugging function of the microcontroller.

* For details of "Control value", refer to the user's manual of 78K0R/KE3-L (U19878E).

See "Start address" is set to "1FC00", and "Size" is set to "1024".

These settings reserve the memory address area for the monitor program (the flash memory area that the debugger uses for on-chip debugging).

In this case, the "Control value" is allocated to the address of C3H in flash memory, and FFH is set to the next address. Because of this, the following areas could not be set the segments.

<Address area that reserved by on-chip debugging>

- 2H, 3H
- CEH-D7H
- From the address set in "Start address" to the byte set in "Size"

– Security ID

Check "Security ID", and enter the security ID which is a unique ID code (10 bytes) to authenticate when the debugger is launched.

The security ID is stored in the flash memory (C4H-CDH), and checked if it is the same as the code entered in Linker options dialog when the debugger is launched.

The debugger will not be launched when the security ID is unmatched. By using this function, you can secure the programs from leaks.

If you do not need to set the security, it is recommended to set the security ID

"FFFFFFFFFFFFFFFF" as this is the initial code.

If you forget about the security ID (stored in the address of C4H-CDH) or if you set wrong on-chip debug option byte, you will not be able to use the debugger (ID78K0R-QB).

To solve this, you can erase the built-in flash memory with "WriteEZ5" for connect to the ID78K0R-QB. For details, refer to "5.4 Erase microcontroller built-in flash memory".

2.4.2 "Output2" Tab

Select "Output2" tab on "Linker Options" window, and see following settings.

- User Option Byte

Check "User Option Byte", and then enter "00FBFF". Here, you can do the setting of watchdog timer, low-voltage detector, and system reserved memory area. The 3 bytes you entered are stored at C0H-C2H on flash memory:

- C0H: setting for watchdog timer
- C1H: setting for low-voltage detector
- C2H: setting for system reserved memory area (must be set as FFH)

This time, you disabled the watchdog timer and the default start function of low-voltage detector. For details, refer to the user's manual, 78K0R/KE3-L (U19878E).

2.5 Set Compiler Options

The compiler options have been set by project file. However, because some compiler options are useful, following two settings are covered specifically in this section.

- Enable C++ comments
- Use multiplier and divider

Select "Tools" on menu bar, then "Compiler options".

2.5.1 "Extend" Tab

Select "Extend" tab, and check "Enable C++ Comment".

This setting allow you to use the C++ comment using "//".

It is useful feature when developing code.

2.5.2 "Startup Routine" Tab

Select "Startup Routine" tab, and check "Using Library" and "Using Multiplier". The 78K0R/KE3-L has feature of multiplier to increase those calculation speed.

2.6 Create Load Module Files

After developing the source code, you have to create load module files by compiling, assembling, and linking. This process is called build.

Click the build button  , or select "Build" on menu bar, then "Build".

Build has been completed successfully.

What is build?

Build is a function that creates an executable file from source files in a project.

PM+ automatically performs compiling, assembling, linking, and other processing actions.

To reduce the time for the build, PM+ detects and compiles/assembles only the files that have been updated from the previous build process.

What is rebuild?

Build compiles and assembles only the source files that have been updated from the previous time, whereas rebuild compiles and assembles all the source files.

When setting, such as compiler options, have been changed, you must rebuild instead of build.

2.7 Check Debugger Settings

After the build, you should configure the debugger settings.

The debugger settings have been set by the project file as well. However, because those settings are important for debugging, some settings are covered in this section.

Select "Tools" on menu bar, then "Debugger Setting...".

Check if "ID78K0R-QB V3.60 78K0R Integrated Debugger" is selected on "Debugger".

If you cannot select "ID78K0R-QB V3.60 78K0R Integrated Debugger", select "Project" on menu bar, "Project settings" -> "Tool version settings" -> "Detailsetting" -> then select "ID78K0R-QB".

2.8 Check Board Settings

Before connecting the PC and the TK-78K0R/KE3L+USB with USB, you should check the setting of switch and jumper pin on the board.

Set the switch and the jumper pin on the TK-78K0R/KE3L+USB as follows.

JP1	Short
JP2	1-2 Short
JP3	1-2 Short
JP4	Short
SW4	Debug Writer

SW1							
1	2	3	4	5	6	7	8
ON	ON	ON	ON	ON	OFF	OFF	OFF

After the switch settings are completed, connect the PC to USB2 on TK-78K0R/KE3L+USB with USB cable.

If the "Found New Hardware Wizard" is started, install USB driver with referring "1.3 Installation of USB Driver".

2.9 Start Debugger (ID78K0R-QB)

Click the debug button  , or select "Build" on menu bar, then "Debug".

If you do not see the debug button, go to "2.7 Check Debugger Settings" for changing the settings.

The steps to start the debugger will be explained below.

"Configuration" dialog is opened.

Please choose "Tool0+Tool1" in the "Target Device Connection"

Enter "FFFFFFFFFFFFFFFFFFFFFF" (F x 20) in "ID Code", then click OK .

Click when the confirmation dialog for downloading load module file is opened.

ID78K0R-QB starts and downloading the program to flash memory.

When the download is completed, the source code will be displayed

NOTE:

Completion of the download does not mean running the programs. Therefore, it does not make anything happened. To run the demonstration, see "2.10 Run Programs".

2.10 Run Programs

Now, you are ready to run the program.

Click the restart button , or select "Run" on menu bar, then "Restart".

The sample program runs.

When programs are running, the status bar will be red.

Connect the PC to USB1 on TK-78K0R/KE3L+USB with USB cable.

Select "Windows Start Menu" -> "Program" -> "Accessories" -> "Notepad".

The alphabet is entered by "SW2" operation to the up side, and pushing the "SW2" starts the new paragraph as follows.

You could confirm the sample program is working.

- For more information about the functions that are used in those sample program, see "USB HID (Human Interface Device) Class Driver application note".

2.11 Stop Programs

Now, you are going to stop the program.

Click the stop button , or select "Run" on menu bar, then "Stop".

When the program stops, the status bar changes back to the original color.

2.12 Close Debugger (ID78K0R-QB)

Select "File" on menu bar, then "Exit".

If you click **Yes**, it saves the settings in the project file, and then closes the ID78K0R-QB. It is recommended to save the settings as it saves the window you used, window size, layout, etc.

If you click **No**, it does not save the settings and closes the ID78K0R-QB.

2.13 Quit PM+

Select "File" on menu bar, then "Exit PM+".

PM+ is closed.

The experiences section ends now.

You can find more information how to use the development tool and information about other useful features in "Chapter 5 Other Information".

CHAPTER 3 Hardware Specifications

In this chapter, the hardware of TK-78K0R/KE3L+USB will be explained.

Microcontroller	μ PD78F1026 ※78K0R/KE3-L(USB)
Clock	External main system clock: 20MHz Subsystem clock: 32.768KHz Internal oscillation clock: 20, 8, 1MHz
Audio	PWM output Filter: LMV324M:NS(U13) AMP: LM4865M:NS(U14) Speaker: 0.3W (for simplified monitoring) Jack: 3.5mm monaural Filter ON/OFF Switchable (SW5) Output Volume (VR1)
Interface	USB MINI B (USB1) USB Function USB MINI B (USB2) Debug/Serial communication Expansion connector 50Pin socket x2 pad only (CN1,CN2) Connector for MINICUBE2 (FP1)
Power supply voltage	5V (USB or AC adapter)
Input/output for operation check use	• 4 ways + center-push switch (SW2) • Dip switch (SW1) • 7Seg-LED (U1,U2) • Reset switch (SW3)

* The name with bracket is the name printed on the board.

3.1 Layout of hardware functions

3.2 Layout of solder-short pad and test pad

3.3 Hardware Functions

3.3.1 SW1, SW4

The bit 1–3 on SW1 are for debug mode settings, bit 4,5 are for mode settings and bit 6–8 are DIP switches connected to P41,P42,P17 pins in microcontroller.

- For the use of ID78K0R–QB, use following settings.

SW1

Bit 1	ON/OFF ※1
Bit 2	ON
Bit 3	ON

SW4 Debug/Writer Side

- *1 **ON:** The microcontroller runs the programs stored in the flash memory as soon as it gets power supply.

OFF: The microcontroller stays being reset until ID78K0R–QB is started.

- To run the programs stored in built-in flash memory without using ID78K0R–QB, or debugging the microcontroller with MINICUBE2, use following settings and re-supply power.

SW1

Bit 1	OFF
Bit 2	OFF
Bit 3	OFF

SW4 K0R <--> K0USB side or Center

- *2 **Set the SW4 center, if you use P11 and P12 on the Expansion connector**

- Bit4 is the switch for POWER LED.

ON	If CPU is supplied power, LED1 is turned on.
OFF	If CPU is supplied power, LED1 isn't turned on.

- Bit5 is the switch for the audio mute.

ON	Audio output is muted by P31output low.
OFF	Non audio mute

- The bit 6-8 are connected to P41,P42, 17 pins in microcontroller. ON means "Low" and OFF means "Open". When you need to use this, you need to set the microcontroller built-in pull-up resistor option registers (PU1,PU4) to ON. For details about settings of microcontroller built-in pull-up resistor option registers, refer to 78K0R/KE3-L User's Manual (U19878E).

SW1

Bit 6	P42
Bit 7	P43
Bit 8	P17

3.3.2 SW2 (INTP0)

SW1 is a 4 ways + center-push switch. When the switch is moved to one of 4 ways or is pushed down, it sends the signal of "Low". When it is released, it becomes "Open" again. You need to set the pull-up resistor option register ON for this function. (For more information about the pull-up resistor option register, refer to the 78K0R/KE3-L user's manual, U19878E)

SW1 Pin Functions (ALPS SKRHADE010)

SW1	Signal Name	Target Microcontroller Pin Name	Operation
1pin	P70	P70 /KR0	UP
2pin	P71	P71 /KR1	CENTER PUSH
3pin	P72	P72 /KR2	LEFT
4pin	P74	P74/KR4/INTP8	RIGHT
5pin	GND	GND	
6pin	P73	P75/KR5/INTP9	DOWN

3.3.3 SW3 (RESET SW)

This is the reset switch. You can reset the microcontroller by pressing this switch.

3.3.4 SW5 (Filter)

SW5 is the slide switch to select use/not use of the Filter (LMV324M). When it sets to "OFF", it does not use the Filter and it inputs sound signals from microcontroller to AMP.

3.3.5 JP1

JP1 is the jumper switch pin for connecting the microcontroller and the filter.

Please set the jumper switch pin short circuit.

Please refer to the circuit diagram for further details.

3.3.6 JP2, JP3

JP2, JP3 are jumper switch pin for selecting the power supply to the CPU.

JP2	JP3	
1-2 Short	1-2 Short	USB power supply from USB2 connector.
2-3 Short	1-2 Short	USB power supply from USB1 connector.
–	2-3 Short	AC adapter power supply from CN3 connector.

3.3.7 JP4

JP4 is the jumper switch pin for supplying the power to the audio circuit.

Please set the jumper switch pin short circuit.

Please refer to the circuit diagram for further details.

3.3.8 LED1 (POWER)

This is the POWER LED. It is lighted when it gets power supply.
You can turn off the LED by setting the bit4 OFF on SW1.

3.3.9 U1, U2 (7segLED)

U1 and U2 are 7segLED.

By setting the 7segLED output data in P20–P23 and setting P50–P53 from Low to High, the data is latched and the 7segLED displays the data.

To display "1" on U1 and "2" on U2:

```
PM2 = 0xf0;           // Set lower 4bit of P2 to output mode
PM5 = 0xf0;           // Set lower 4bit of P5 to output mode
PM11.0 = 0; PM11.1 = 0; // Set P110, 111 to output mode
P2 = 0xf9; P5 = 0xf9>>4; // Set data for "1" in P2 and P5
P11.0 = 0; P11.1 = 1;   // Set P110 to Low, then High
P2 = 0xa4; P5 = 0xa4>>4; // Set data for "2" in P2 and P5
P11.1 = 0; P11.1 = 1;   // Set P111 to Low, then High
```

3.3.10 CN1, CN2

The connector for CN1, CN2 expansion connection.

The connector was not installed. (HIROSE ELECTRIC CO., LTD. HIF-3H-50DA-2.54DSA)

3.3.11 CN3

This is the connector for AC adapter. Please, connect the bundled AC adapter (+5V).

- Support plug : 2.1mm DC jack (center plus)

3.3.12 J1

This is the jack for external speakers.

Connect a speaker when you play sound.

- Support jack: 3.5mm (monaural)

3.3.13 VR1

Audio output volume control.

If the audio mute is set, then audio is not output.

3.3.14 USB1

USB connector for the USB function controller.

3.3.15 USB2

USB connector for the debug / serial communication.

It was found as 「NEC Electronics Starter Kit Virtual UART」.

3.3.16 FP1

This is the interface for connecting MINICUBE2.

3.4 Solder-short pad label

With using the solder-short pad to cut the circuit, users can customize the circuit.

The solder-short pad looks like the picture below.

To open, use cutter to cut the dent part. To short, put solder on the pad.

Solder-short pad
(Open)

Solder-short pad
(Short)

Solder-short pad name	Before Shipment	Connection	
P120	Short	Short	P120 is connected to USB1 bus power detecting signal.
		Open	You can use P120 for multipurpose IO.
P16	Short	Short	P16 is connected to audio circuit.
		Open	You can use P16 for multipurpose IO.
P31	Short	Short	P31 is connected to audio muting circuit.
		Open	You can use P31 for multipurpose IO.
AVREF	Short	Short	VDD = AVREF
		Open	AVREF is separated from VDD.
EVDD	Short	Short	VDD = EVDD
		Open	EVDD is separated from VDD.
P110,P111	Short	Short	P110 and P111 are connected to 7Segment LED data latch circuit.
		Open	You can use P110 and P111 for multipurpose IO.
P20~P23、 P50~P53	Short	Short	These are connected to 7Segment LED data latch circuit.
		Open	You can use the ports for multipurpose IO.
RIGHT	Open	Short	External speaker output connector J1 is connected as stereo connector.
		Open	Connection for the monaural connector.

Note: All ground signals are each connected.

CHAPTER 4 Troubleshooting

This chapter describes how to solve troubles you may face.

4.1 If you cannot find USB driver when you connect PC to the kit

Check Point 1

If you use USB hub, do not use it. (USB hub is not supported)

Check Point 2

Check if you installed "Starter Kit USB Driver" in "[1.2 Installation of Development Tools](#)". If not, install the driver.

Check Point 3

Check if the settings of switches on the kit are correct with referring to "[1.3 Installation of USB Driver](#)".

Check Point 4

If above 3 check points are confirmed, disconnect the USB cable from PC and re-connect again. It should show the "Found New Hardware Wizard" wizard. Operate the installation with referring to "[1.3 Installation of USB Driver](#)". After the installation, make sure you go through "[1.3.3 Completion of USB Driver Installation](#)" to confirm the USB driver installation.

4.2 Error when you start the debugger

There could be several reasons to make errors happen.

The solving processes differ depending on errors. Please check the error message first.

The solving processes for each error are as follows.

4.2.1 "Can not communicate with Emulator..." (F0100 or A0109)

Check Point 1

If you use USB hub, do not use it. (USB hub is not supported)

Check Point 2

Check if the settings of switches on the kit are correct with referring "[1.3 Installation of USB Driver](#)".

Check Point 3

Confirm the USB driver installation with referring to "[1.3.3 Completion of USB Driver Installation](#)".

Check Point 4

If above 3 check points are confirmed, close the debugger and disconnect the USB cable from PC. Re-connect USB cable properly to both the PC and the kit, and then re-start the debugger.

4.2.2 "Incorrect ID Code." (Ff603)

This error occurs when the security ID stored on microcontroller built-in flash memory is different from the ID code you entered at the start of debugger.

Security ID entry area at the start of debugger

Check Point 1

Enter correct security ID and click OK on the configuration window.

Check Point 2

If you forgot the security ID, you have to erase the microcontroller built-in flash memory. Before erasing, check if you actually set the security ID with referring to "[2.4 Set Linker Options](#)". Also remember the code you set for the security ID.

After this, erase the flash memory with referring to "[5.4 Erase microcontroller built-in flash memory](#)".

4.2.3 "The on-chip debug function had been disabled in the device." (F0c79)

This error occurs when the value at address C3H (On-chip debug option byte) in microcontroller built-in flash memory is incorrect. You need to erase the flash memory.

Check Point 1

Check if you actually set the correct on-chip debug option byte with referring to "[2.4 Set Linker Options](#)". If it is not correct, then set correctly.

Check Point 2

Erase the flash memory with referring to "[5.4 Erase microcontroller built-in flash memory](#)".

4.2.4 "Disabling the on-chip debug function is prohibited." (F0c33)

Basically, this error occurs when you start (download) the debugger without doing the settings described at "[2.4 Set Linker Options](#)". Do the same checking processes as "[4.2.3 The on-chip debug function had been disabled in the device. \(F0c79\)](#)".

CHAPTER 5 Other Information

This chapter explains some useful operation techniques of development tools and circuit diagram of the kit for developing of user programs.

[6.1 Create a new workspace \(project\)](#)

[6.2 Register additional source file](#)

[6.3 Debugger tips](#)

[6.4 Circuit diagram](#)

5.1 Create a new workspace

Now, create a new workspace and project.

PM+ allows you to create a new workspace with following "New WorkSpace" dialog.

Select "File" on PM+ menu bar, then "New Workspace..."

"New WorkSpace" dialog opens

<Description of items>

Workspace File Name:

- > Specify the name of the workspace file that manages the project files.
.prw is automatically suffixed as the file type.
A project file (.prj) of the same name is simultaneously created.

Folder:

- > Specify the folder for saving the workspace file by writing its absolute path.
This item can be selected from a reference dialog box by pressing the **Browse...** button.

Project Group Name:

- > Specify this item if wishing to manage multiple projects together in function units.
If nothing is specified, this item is the same as the workspace file name.

Microcontroller Name:

- > Specify the name of the microcontroller to be used.

Device Name:

- > Specify the name of the device to be used.

The concrete information set here is described on the following pages

Input the workspace information setting as follows.

Workspace file name

→ test

Folder

→ C:\TK78K0R

Project Group Name

→ (no input)

Microcontroller Name

→ 78K0R

Device Name

→ uPD78F1026_64

Click **Next >** button

Click **Yes** button

Click **Detail Setting** button

Set the version of tools as follows.

CC78K0R:W2.12

RA78K0R:W1.33

ID78K0R-QB:V3.60

Select tools as above screenshot, then click **OK**.

Click **Next >**

Click **Next >**

Select ID78K0R-QB V3.60

Click **Next >**

Click **Finish**

This completes workspace and project creation.

Additional source files can be registered at any time thereafter.

For details, refer to "[6.2 Register additional source file](#)".

Also, you need to do the settings for on-chip debug. Please refer to "[2.4 Set Linker Options](#)", "[2.5 Set Compiler Options](#)", and "[2.7 Check Debugger Settings](#)".

5.2 Register additional source file

Now, register additional source files.

The following example shows the additional registration of source files "b.c" and "c.c" with source file "a.c" already registered.

Place the cursor on the source file in the Project window of PM+, and select [Add Source Files...] displayed in the right-click menu.

Select source files "b.c" and "c.c", then click **Open**

Multiple source files can be selected by clicking them with pressing **Ctrl** key.

Source file "b.c" and
"c.c" are additionally
registered to the project.

5.3 Debugger tips

This section describes some useful techniques for the debugger (ID78K0R-QB).

5.3.1 Change display of buttons

Execution controls (run, stop, step-in debugging, reset, etc) and opening functional window can be made by below buttons. However, it could be difficult to know which button does what.

In this case, select "Options" on menu bar, then "Debugger Options". Check "Pictures and Text" on setting area.

With this setting, the buttons display the text as well, so that it is easier to know what they are.

5.3.2 Display source list and function list

When you wish to see source file list or function list, select "Browse" on menu bar, then "Other" -> "List" to open the list window. The information in the windows is synchronized. Therefore, it is not just for referring to the list, but it is useful when you wish to update files or functions.

When you click "game1"...

Source window shows "game1"

5.3.3 Set/delete breakpoints

Breakpoints are executed by clicking lines in which " * " is displayed

"B" is displayed in the line where a breakpoint is set.

Breakpoints are deleted by clicking "B".

5.3.4 Display global variables

With using Watch Window, you can display global variables. There are several ways to register global variables to watch window. In this section, how to register from source window is described.

- ①Right-click the variable on source window, then select "Add Watch..."

- ②Add Watch dialog opens. Click **OK**.

- ③Adding a variable to watch window is completed.

5.3.5 Display global variables while programs are running

RAM, general-purpose register, and SFR can be referred by the pseudo real-time monitor function even when the programs are running.

Select "Option" on menu bar, then "Extended Option...". Configure the settings for "RAM Monitor And DMM".

Specify the sampling interval time of the pseudo real-time monitor function.
The sampling time can be specified from 0 to 65500 with unit of 100ms.
It will not monitor if it is set to "0" or blank.

This completes the settings.

Note:

- The user program momentarily breaks upon a read.
- Do not use the pseudo real-time monitor function while using the memory window. It uses the system resources significantly as it monitors the displaying memory as well.
- It is recommended to close the memory window when you use the pseudo real-time monitor function.

5.3.6 Display local variables

Local variable window is used to display local variables.

By clicking the button below, you can open the local variable window.

Unlike global variables, local variables cannot be displayed when programs are running.

5.3.7 Display memory and SFR contents

By clicking the button below, you can open the memory window.

By clicking the button below, you can open the SFR window.

5.4 Erase microcontroller built-in flash memory

If the On-Chip Debug Option Byte is set to "Do not erase data of flash memory in case of failures in enabling on-chip debugging" and if you forget the security ID, you need to erase the flash memory completely.

To erase the flash memory, please follow the steps below.

WriteEZ5 is installed at "1.2.2 Installation of Development Tools".

- ① Start WriteEZ5 by selecting "Windows Start" menu, "Programs", "NEC Electronics Tools", "WriteEZ5", "V1.00", and "WriteEZ5".

- ② Set the switch and the jumper pin on the TK-78K0R/KE3L+USB as follows.

JP1	Short
JP2	1-2 Short
JP3	1-2 Short
JP4	Short
SW4	Debug Writer

SW1							
1	2	3	4	5	6	7	8
ON	ON	ON	ON	ON	OFF	OFF	OFF

- ③ Then, please connect the PC to “USB2” on the TK-78K0R/KE3L+USB with the USB cable.

- ④ Push the 「Setup」 button.

- ⑤ Push the 「PRM File Read」 button.

- ⑥ Please select "78F1026.prm" in the directory of "¥PRM78F1026_V100" in the CD-ROM.

- ⑦ "Port" selects the COM port number where TK-78K0R/KE3L+USB is allocated.
* Only the COM port number that the personal computer has is displayed in this pull-down menu.

- ⑧ "Erase" The deletion of the flash memory begins when the button is pushed.

- ⑨ If Flash EEPROM has been erased successfully, "chip erase finish" will be displayed as shown below.

※ ID Code

The ID Code is a mechanism to prevent an unwelcome third party from accessing your source code by initiating the debugger. Therefore, it is recommended to modify the ID Code from the default value to secure your original source code. However, once you modify it, then, if you forget the security ID or mistakenly over-write 0x00(value) to the address of 0xC3, the debugger ID78K0R-QB is unable to access to the CPU via OCD interface. In this case, you have to start over from erasing all data in the Flash EEPROM. Then, you can define the new ID Code. You may load your source code from the debugger with a load module file.

5.5 Circuit diagram

From following page, it shows the circuit diagram of the demonstration kit.
